A Correction

In the issue of February 18-25, 1995, current statistics on "Money and Banking" contained an error in money multiplier ratios; the relevant lines are corrected as follows and should read as multiples and not as percentages. The error is regretted.

Monetary Ratios	Variation		Quarterly Variations						Full Financial Year Variation		
	Dec 23, 94- Jan 20, 95	Oct 94- Dec 94	July 94- Sep 94	Apr 94- Jun 94	Jan 94- Mar 94	Oct 93- Dec 93	July 93- Sep 93	Apr 93- Jun 93	1993-94	1992-93	1991-92
End-Period											
Money multiplier: M3/RM	3.15	3.21	3.25	3.09	3.13	3.25	3.32	3.39	3.13	3.31	3.19
Incremental:											
Money multiplier: ΔM3/ΔRM	0.68	1.95	-6.20	2.52	1.80	2.22	1.82	6.99	2.40	4.38	4.40

Notes: (i) Superscript numeral denotes month to which figure relates, e.g., superscript 7 stands for July. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year. (iii) — means not available.

Pangs of Readjustment

The rather painful readjustment of the money market, from a situation of externally-injected excess liquidity to one of liquidity shortage, has been seen in (a) selling pressure on equities, PSU bonds, UTI units and gilt-edged; (b) drying up of the market for such money market instruments as bills and CP; and (c) firming up of interest rates, both short- and long-term.

I Macro Backdrop

THE events of February in the money market seem to show that the pangs of readjustment from a situation of externally-injected excess liquidity to that of domestic liquidity shortage, which began about three months ago, have become acute. For about a year and a half since March 1993, the Reserve Bank of India (RBI) injected approximately Rs 40,000 crore of cash into the system by purchase of foreign currency assets at a uniform rate of Rs 31.37 per US dollar so as to ensure a certain level of export profitability. Of this sum, nearly one-half was attributable to inflows of portfolio capital which generated a situation of abundance in the money market and disproportionate appreciation of equity prices in the capital market. Secondly, once the foreign institutional investors (FIIs) began to book profits and to generally shift their attention from the emerging markets to markets in the US and other developed economies, equity prices have plunged to lower levels, as a result of which investments made by corporates and Indian financial institutions got stuck and could not be unwound. This in turn has apparently compelled the corporate bodies to dislodge their holdings of US-1964 units of the Unit Trust of India (UTI), thus imposing a heavy repurchase obligation on the UTI. Though the UTI has denied that it was resorting to heavy selling in the share markets to pay the corporate sector, it cannot be disputed that this whole episode has contributed to the drying up of liquidity in both the capital and money markets, thus bringing into sharp focus the growing integration of these two legs of the financial market with the immense potential for destabilisation of both the markets which the authorities, who are assiduously promoting and nursing such an integration, may not care to recognise.

Finally, much the larger part of the liquidity generated out of portfolio inflows has been used up by the government essentially to finance its whopping revenue deficits in 1993-94 and 1994-95 (though the final outcome this year is yet to be known). This became an extremely convenient outlet for banks to deploy their deposit resources in the form of excess investment in SLR securities when their lending activities were hamstrung by both supply constraints emanating from capital adequacy and other prudential norms for commercial lending imposed on them by the RBI and demand constraints due to sluggish industrial activity up to the end of March 1994.

The above situation has undergone a dramatic change in recent months. The authorities' measures to restrain capital inflows have coincided with a drastic curtailment of portfolio investment by the FIIs. In turn, the reduced foreign inflow combined with (a) the reassertion of the Indian economy's high import propensity (non-POL imports rising by 32 per cent in 1994-95 so far) and (b) sluggish domestic saving has suddenly tended to upset the liquidity scenario. Simultaneously, there has occurred a massive demand for bank credit from the commercial sectors. On the one hand, faced with serious contractions in budgetary allocations, the public sector undertakings (PSUs) seem to be drawing upon their credit limits with banks, and on the other, the bigger private sector companies have also been forced to rely on larger amounts of bank credit in replacement for GDRs, CPs and other forms of earlier non-credit borrowings. (Corporates generally had a low credit base as for three years their borrowings had been sluggish). The government's massive borrowing programme of Rs 25,700 crore (including 364-day treasury bills) for 1994-95 was predicated on the persistence of abundant liquidity. Now, there is a backlog of about Rs 5,000 crore essentially due to a large shortfall of Rs 10,637 crore under 364-day treasury bills; there is of course excess borrowing of Rs 5,597 crore under conversions and zero coupon bonds. Besides, disinvestment of the government's equity holdings in PSUs has so far fallen short by Rs 1,300 crore of the target of Rs 4,000 crore. Also, the strain on liquidity has been considerably accentuated by over Rs 60,000 crore of primary issues during the past two years in the form of public and rights issues including private placements through bonds of public sector bodies and financial institutions. These demands on the financial system were in part stimulated by the earlier abundance of liquidity which cannot be met now in the face of an all round shortage.

The process of readjustment to the new situation of stringency is seen in (a) distinct and all round selling pressures on corporate equities, PSU bonds, units of UTI and gilt-edged securities; (b) drying up of the market for such money market instruments as bills and commercial paper (CP); and (c) substantial firming up of interest rates, both short-term and long-term. The authorities have been forced to formalise the up-trend in market interest rates contrary to their earlier hope of pushing down the rates so as to help revive economic activity; this they have been forced to do also because the inflation rate has further accelerated, almost threatening to produce a crisis situation. While freeing the lending rates of scheduled commercial banks for credit limits of over Rs 2 lakh in October 1994, the RBI had justified it on the ground that "perhaps the best period for deregulation of interest rates would be a period when inflationary pressures have abated". While interest rates were required to be brought down on grounds of economic revival, its deregulation was certainly premature. Within a span of about three to four months, the RBI has been compelled to raise the maximum interest rates on term deposits of banks by 1 percentage point to 11 per cent as of February 10 this year precisely on the ground of an accentuation of the inflationary situation. This has been immediately followed by banks and financial institutions stepping up their prime lending rates by 1 full percentage point to 14.5 per cent, 15 per cent or 15.5 per cent, as the case may be.

The severity of the growing money market stringency and the complexity of the readjustment process to the new situation is reflected in the RBI having to pump as much as Rs 3,000 crore in December/January and another Rs 3,100 crore in February into the money market for brief periods through the DFHI and STCI, despite its inflation and primary money growth anxieties and despite its conviction that "the credit expansion has clearly been excessive to what is warranted by the developments in the real sectors" (S S Tarapore, deputy governor, RBI, in a speech delivered to the Pune chapter of the Indian Banks' Association in early February). As referred to earlier, this year credit expansion may be justified on the ground that it has occurred over a low base as, for the preceding three years continuously, bank credit expansion has been unduly poor and that the expansion may also have been in replacement of many non-bank credit sources the corporates had

used earlier, such as the GDRs, commercial paper (CP) and bills rediscounting. Banks have also been disinvesting a part of their excess SLR investments.

A more significant fact is that there is a growing asset-liability mismatch amongst some banks as they are said to have overextended themselves beyond their deposit base and relied excessively on money market borrowings – a general refrain now of the Reserve Bank of India. But this is a situation of the authorities' own creation; they have considerably increased the number of institutional and other participants in the overnight money market, particularly in a situation where there is some interest rate regulation on bank deposits. The call money market ought to have remained essentially an inter-bank market, thus forcing the financial institutions and corporates with surplus funds to opt for marketable instruments of the money market like CP and bills rediscounting and even PSU and other bonds, treasury bills and government securities, all of which could have received an impetus and consequently some depth in trading. This has been prevented by the current policy of allowing more participants in the overnight money market. This has created another unhealthy situation in that there is now a free flow of funds between the money and capital markets as all those investment and other financial institutions like the UTI, LIC and GIC permitted to participate in the call money market have large investments in corporate equities. Above all, availability of their float funds also in the call money market undoubtedly entices banks,

particularly the foreign banks with a limited deposit base, to borrow and to extend credit even if it is far beyond prudent limits. Having thus unbolted the door after the horse has fled, obviously the authorities' bemoaning of asset-liability mismatch is a cry in wilderness.

Be that as it may, the growing mismatch between banks' assets and liabilities is evident from the fact that the quarterly incremental credit-deposit ratios of scheduled commercial banks, which ranged from 11 per cent to 42 per cent during each of the six quarters in April 1993 to September 1994, jumped to 158 per cent in the quarter October-December 1994 and further to a whopping 244 per cent between end-December and February 17. The non-food credit expansion works out to Rs 30,533 crore or 20 per cent in the current fiscal year so far as against Rs 5,600 crore or 3.9 per cent in the corresponding period last year. It is true that during the recent period banks have retired a part of their excess SLR investment which fell from Rs 1,51,093 crore towards end-December 1994 to Rs 1,48,356 crore as of February 17.

Given the shortage of liquidity, there has arisen a stiff competition for deposits, with some banks offering the maximum rate of 11 per cent (or the earlier 10 per cent) for the shortest tenure of 46 days on deposits. Banks have also resorted to other ways to generate funds, one among them being the costly certificates of deposit (CDs). Corporation Bank announced an issue of Rs 400 crore in January. In February it issued an advertisement for attracting deposits through this route and also

got itself credit rated from CRISIL. Union Bank of India too has announced an issue of Rs 1,000 crore worth of CDs. The response to both these issues is not known.

II Market Developments

HIGH BENCHMARK RATES FOR CALL MONEY

After witnessing turbulence in December and January, the call money market opened on a quiet note in February but this did not last long, as by February 6 it had already touched 13-14 per cent. Further, unlike in the previous months, the benchmark rate prevailing on majority days of the month has turned out to be as high as 15 per cent (Graph A). Apart from the growing stringency in the market, banks' anxiety to satisfy the new requirement of maintaining 85 per cent CRR on a daily basis for the first 13 days of a reporting fortnight seems to have played a role. However, the expected narrowing of the volatility in call money rates as a result of this measure is yet to be achieved (Table 1). Also, interestingly the intra-day rates have begun to show larger volatility. Now the daily rates invariably open higher than the previous day's level, firm up as the day progresses and get settled at lower levels towards closing hours. This is due to the fact that the deficit banks have to borrow during the day to be able to satisfy the 85 per cent CRR on a daily basis. The month of February has also seen the reinforcement of the State Bank of India's monopoly position in the money market as financial institutions like the UTI were short of liquid funds. In general, the money market players do express uneasiness about the monopolistic clout that both the SBI and the UTI command.

In the first week ending February 3, the single-digit call rates led several banks to repay the 11 per cent export refinance to the RBI. This week saw a contraction of Rs 7,346 crore in RBI credit to banks and commercial sector. Besides, the RBI returned to subscribers the over-subscribed amount on the last zero coupon bond auction and some 364-day treasury bills matured during the period. Due to a decline in the call rates, the forward premia for the US dollar in the Indian inter-bank market remained soft though still above 6 per cent for six months.

The second week of the month began to reflect tightness as the rates rose from single-digit levels in the previous week to 14-15 per cent. In the early part of the week, the State Bank was not lending in the market; later when it started lending, the rates came down to 11.75-9.00 per cent by February 10. By then most banks had covered their position by borrowing under repos through the DFHI and STCI to hedge against possible high call rates. There was a Rs 4,925 crore rise in RBI credit

to banks and commercial sector during the week ended February 10. The period also saw an upward movement in forward premia for the US dollar *vis-a-vis* the rupee following the shortage of dollar due *inter alia* to a sharp drop in pre-shipment export credit in foreign currency as the cost advantage was almost wholly wiped out with the cost of forward cover working out to nearly 15 per cent, that is, 8 per cent lending rate and 6.5 per cent forward premia.

The February 11-17 week saw again sudden firming up of the call money rates despite it being the second lap of the fortnight; the RBI's weighted average of call rates steadily moved up from 10.91 percent in the first week to 13.25

per cent in the second and 15.27 per cent in the third week (Table 2). The actual rates ruled generally between 15-16 per cent on February 14, 25-40 per cent on February 15 and 25-10 per cent on February 16. The indication that the SBI turned a borrower and resorted to borrowings from DFHI aided the market sentiment. Apparently, the SBI was using its rupee resources to buy foreign exchange largely on behalf of oil companies and the defence establishment, which generally attempt to use up their budget for the fiscal year. In fact, stray call money quotations were reported to be as high as 30 per cent on February 14 and 60 per cent on the next day. This was the period when the SBI and UTI were generally absent from

the call money market and the RBI is reported to have pumped in Rs 2,000 crore on February 15 and again another Rs 1,500 crore the following day. With these developments on the supply side and with most banks covering their positions by the reporting Friday on February 17, the call rates on that day dipped to 0.25-2.00 per cent.

Again, during the third week of February 18-24, the call money rates remained firm in the range of 13.00-15.50 per cent - a situation which continued till the end of the month, reflecting the persistence of all round shortage of liquidity. Financial institutions like the UTI could not participate actively in the call money market as they themselves were cash-strapped.

It was during this period that the UTI was expected to repurchase about Rs 1,150 crore worth of US-64 units. Though the UTI clarified that this repurchase constituted only about 6 per cent of the US-64 corpus of Rs 18,000 crore, there was no gainsaying that, as referred to earlier, it did create some stringency in the money market. Besides, it is reported that with the tax-concessions for inter-corporate dividends hitherto received on units almost eliminated and with interest rates ruling high elsewhere as in the inter-corporate deposit market (ranging from 14 to 25 per cent depending upon the risk profile of a company), corporate funds have stopped flowing into the units. The UTI has stopped selling US-64 units to banks and corporates directly since July 1994 and instead it has introduced a separate US-95 scheme principally for the corporate bodies with a minimum subscription level of Rs 1 crore. As a result, corporates have been moving out of their current holding of US-64 units which has tended to depress their prices even below the repurchase price of Rs 17.90. Incidentally, as at the end of June 1994, corporate bodies held 63.14 per cent or Rs 7,450 crore out of a total outstanding unit capital of Rs 11,800 crore under the US-64 scheme (including the rights offer of about Rs 2,757 crore).

FOREIGN EXCHANGE MARKET IMPULSES

As a mirror image of the short-term domestic money market, forward premia in the foreign exchange market has not only firmed up during the month but also sustained a stubborn benchmark annualised premium, of about 6.5 per cent for the six-month US dollar-rupee swap transactions. Initially, the forward premium was around 6 per cent when the call money rates were soft but thereafter it generally remained around or above 6.5 per cent. Interestingly, despite market rumours of devaluation and such other uncertainties, importers seem to have gone ahead with swap contracts of six months, thus generally pushing

up the long-term premia during the period (Graph B), while the premia for the cash/spot transactions remained moderate almost throughout the month except the fag end of the month when the cash/spot purchases of foreign exchange increased (Graph C).

Towards the last 10 days of the month, there occurred considerable unsettling of the foreign exchange market essentially due to a scramble for foreign exchange; it was reported that even the havalala rate for the US dollar had shot up to a high of Rs 36 per dollar. The scarcity was reflected in the rupee-dollar exchange rate in the inter-bank market touching Rs 31.47 thus piercing the recent high of Rs 31.45 reached in November 1994. Cash/spot purchases of the dollar due to the year-end bulk demand for foreign exchange by oil companies and defence purchases seem to have already begun to be felt in the weakening of the rupee; it is obviously serving as a major factor at the margin for liquidity shortages in the money market.

Also, during the last 10 days of the month, the forward premia for the US dollar was maintained at a high level of over 6.38 per cent (six months) due to heavy offering of six-month forward sale by exporters even when there was large-scale import demand. The month end also saw a scramble for the dollar as a result of which the rupee experienced one of the most volatile days (February 24) and rupee-dollar touched Rs 31.3850.

OPEN MARKET OPERATIONS

On February 3, the Reserve Bank announced the sale price of Rs 98.33 for the 12 per cent government paper maturing in 1999. At a YTM of 12.51 per cent the offer was attractive when compared with the YTM of 12.39 per cent offered by the market on similar paper, that is, zero-coupon bond 1999. The offer was in contrast to the 6.25 per cent 1996 stock put on the sale list towards the end of January by the central bank, which evoked no response as its yield was below market expectations.

The RBI was able to sell only Rs 25 crore worth of 12 per cent 1999 security at Rs 98.33 on February 7 as the market got the better of the deal and improved the yield to 12.53 per cent as against the RBI's 12.5137 per cent by offering a price of Rs 98.28 the next day.

On February 24, the Reserve Bank revised its sale price of 12 per cent 1999 security to Rs 98.40. This meant a YTM of about 12.53 per cent. Even after the improved yield, the market did not respond favourably. The purchase of zero coupon bonds 2000 at the issue price of Rs 54, however, evoked much response with the market off-loading Rs 265 crore worth of this security over two days, February 23 and 24, back to the Reserve Bank. At the issue price the YTM was 12.8587 per cent on the first day and had improved to 12.8661 per cent on the second day.

PRIMARY MARKET AUCTIONS

Dated Securities

The month began with the auction of five-year zero coupon bonds for a notified amount of Rs 2,000 crore maturing in the year 2000. The Reserve Bank floated the issue on January 28. As if turning the tide against the market, the auction received more than full response; 142 bids were received for an aggregate amount of Rs 2,393.30 crore. Of these, 106 bids worth the notified amount of Rs 2,000 crore at a cut off price of Rs 54 were accepted. This worked out to a yield of 12.71 per cent. The Reserve Bank had paid a yield of 12.75 per cent for the five-year zero coupon bond issued in 1994.

As it turned out later, the market had not expected the government to relent to the market demand of higher yield but had put in the amount and expected rejection. To their surprise, the Reserve Bank upped the yield considerably and accepted bids up to Rs 2,000 crore. Having been caught unawares, the market looked for a way out and off loaded Rs 265 crore worth of zero-coupon bonds 2,000 in favour of the Reserve

Bank as capital as it opened for purchase window on February 1.

91-Day Treasury Bills

There were the usual four weekly auctions of 91-day treasury bills during the month and two fortnightly auctions of 364-day treasury bills. For even a notified amount of Rs 50 crore, the Reserve Bank found it increasingly difficult to attract response despite hiking the yield rate at each successive auction for the 91-day treasury bills. The cut-off yield on this paper was raised from 11.10 per cent in auctions of January-end or early February to 11.48 per cent towards the month end. This was a clear 3.25 percentage points more than the cut-off yield rates a year ago. Even when the interest rates were ruling very high, the highest cut-off yield accepted on this instrument was only 11.10 per cent in April 1993. Since then it steadily declined for more than a year and a half, until September 1994. What is more, despite such high return for investors, the amount bid at the cut-off price (or higher) was a puny at Rs 2-4 crore in each of the February auctions, whereas last year the RBI obtained as much as Rs 400 crore each. The only saving grace was that one state government kept on subscribing as a non-competitive bidder for Rs 50 crore and walked away with a substantial portion each time (ranging from Rs 46 to Rs 48 crore) to book reasonable profits (Table 3).

364-Day Treasury Bills

Similarly, the response for 364-day treasury bills too was extremely thin. By the end of the month, the government paid almost the same rate of return on 364-day bills as it paid on 91-day bills. The cut-off yield rates on 364-day bills at the two auctions of February were 11.23 per cent and 10.48 per cent respectively; the latter rate has been the highest ever offered on the 364-day treasury bill since its inception on April 28, 1992, the earlier highest being 11.42 per cent offered during auctions of April-June 1992. Last year, the corresponding rates were 10.75 per cent and 10.63 per cent. Total amount collected during February this year against these auctions was Rs 30 crore as against Rs 3,028 crore in February 1994 (Table 4).

Repo Auctions

The only one repo auction undertaken during the month also came to naught as the Reserve Bank received only one bid and that too was rejected (Table 5). As the purpose of the 14-day repo operation of the central bank was to even out liquidity in the money market, it seems to have outlived its utility particularly after the prescription of 85 per cent CRR maintenance by banks on a daily basis; the RBI has not undertaken the second repo auction of the month.

Implications for Limits on Ad Hoc Treasury Bills

The distinctly poor response to 91-day and 364-day treasury bills even after offering the highest ever yield rates has a lesson to offer

in the future of financing the budget deficit. The RBI concluded on September 9, 1994 to limit the use of *ad hoc* treasury bills for financing the budget deficit to Rs 6,000 crore during 1994-95 and to phase out the automatic monetisation of the budget deficit in the subsequent two years; from 1997-98, this instrument is to be totally abolished. Under the agreement, if net issues of *ad hocs* exceed Rs 9,000 crore for more than 10 consecutive working days during the current fiscal year, the RBI would automatically reduce the level of *ad hocs* by auctioning treasury bills or by selling fresh government of India dated securities in the market. The government will easily sail through the current year as its dependence on the RBI so far has been limited but some similar ceilings, probably somewhat lower, for the next two years, 1995-96 and

Figures in brackets represent numbers and amounts of non-competitive bids which are not included in the total.

@ Outstanding amounts are estimated for all weeks of February 1995.

1996-97, will have serious implications for the money market rates, as also general rates of interest in the economy.

SECONDARY MARKET

NSE and SGL Transactions

The secondary market, especially the repos in government paper, witnessed considerable activity during the month. Though substantial amounts were traded in dated securities and 364-day treasury bills through outright sales, the amounts recorded in repo deals far outpaced outright transactions (Appendix Table). Of the total amount of SGL transactions worth Rs 8,403 crore in February, as much as Rs 6,083 crore, or 72.4 per cent, was in the form of repos. Among the repo transactions also, a somewhat larger amount was traded in government securities than in treasury bills. In fact, on days close to the reporting Fridays, phenomenally high levels of over Rs 1,000-2,000 crore were transacted in repos of dated securities.

The action of banks clearly indicated that they used the repo mode of transactions to overcome their problem of short-term liquidity. The preference for large amounts of repos in government securities despite holding of Rs 30,000 crore worth of excess SLR securities also indicated that the returns on this paper still make the holders keep them rather than sell them off.

State government paper also was actively traded. Though in terms of amounts the deals constituted only a fraction of the total value traded in gilt-edged paper, in terms of number of deals state government paper was quite

significant. The securities of Maharashtra, Kerala, Andhra Pradesh, Gujarat, Tamil Nadu, Bihar and West Bengal were active in the secondary market. This indicated that the banks and institutions parting with state government securities were anxious to minimise their losses, if any.

The National Stock Exchange performance continued to be stable with a large gap between the order value and the traded value (Table 6), though the size of trading in February has been significantly higher than in earlier months. The NSE data also reveal that the selling pressure on money market instruments persisted during the month.

Increasing Inversion of the Yield Curve

The phenomena of rising yields on various money market instruments and the yields of short-term government paper rising at a faster pace than those of long-term securities, thus contributing to an inversion of the yield curve, began in last December. These phenomena have not only persisted in the months of January and February but have got further intensified with the spread between yields on short-term and long-term securities getting increasingly widened. Generally, in February the yields to maturity for 91-day treasury bills worked out to over 15 per cent, those for 364-day treasury bills worked out to 12.5-13 per cent and those for dated government securities 12-12.8 per cent. As graphs E, F and G clearly indicate, the inversion of the yield curves is getting to be very distinct. The literature on yield curve based on the experience of advanced countries' money markets tells us that an inverted yield curve derived from secondary market

transactions generally portends an ominous sign of a slow-down in economic activity; with expectations of weaker real income growth, interest rates in general and short-term rates in particular should decline. These expectations are also associated with an expected fall in inflation rate. In India, the secondary markets lack technical depth and are also controlled by a few large operators; they face various other structural disabilities. Hence, it is difficult to read too much into their expectational abilities. The only statement that can be made with certainty is that the money market in India has been facing increasing stringency and that the operators in it are using various short-term instruments to cope with the situation.

Other Instruments

Other instruments, such as commercial paper, certificates of deposit and commercial bills remained steady during the month. During the second reporting fortnight of the month, however, the rates firmed up by a full one and a quarter percentage points indicating the overall firmness prevailing at the short-end of the market.

Commercial paper for 90 days in the secondary market was quoted in the range of 12.25-13.75 per cent; there were no quotes for 180-day paper. Commercial paper issued by BPL, Kotak Mahindra Finance, SAIL and Voltas were traded in small amounts. Interestingly, the rates on this instrument firmed up in the second fortnight of the month and ranged between 13.50-14.25 per cent.

Certificates of deposit remained steady at 13-15 per cent for one-year paper. There were no quotes for 91-day paper. Typically,

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction.

2) Current yield has not been worked out for treasury bills.

in a market where interest rates are high, while borrowers prefer to borrow for a short period, lenders prefer to get locked in at a higher rate for a long or a medium term.

The inter-corporate deposit market for 30 days also firmed up from 14-15 per cent in the first reporting fortnight to 14.50-16 per cent in the second reporting fortnight. Similarly, the 90-day deposits which were available in the first reporting fortnight at

15-16 per cent firmed up at 16-17 per cent in the second reporting fortnight of the month. Even 180-day deposits firmed up and stabilised at rates ranging from 16-17 per cent to 17-19 per cent.

In contrast, the commercial bills market was virtually dormant. While 30-day bills fetched a rate of 12.50-14 per cent, there were no quotes in 60- or 90-day market. Historically, big-size corporate bodies are known to have

been drawing their cash credit limits with banks fully in tight money market situation only to lend the money back in the call money market albeit surreptitiously. Though there is no official data available on this aspect, it is likely that funds drawn through the cash credit window were deployed in the money market.

[The statistical tables for this note have been compiled by V P Prashant.]

Road to Peace between Pakistan and India

Nirmal Mukarji

The convention organised by the India-Pakistan People's Forum for Peace and Democracy in New Delhi last month, in which around 200 delegates in roughly equal numbers from the two countries participated, was the largest such gathering till now. Its wholly non-governmental character and its squarely political agenda clearly distinguished it from all previous exercises.

THE people of Pakistan and India want genuine peace and friendship. Their governments do not. For they have engaged in the politics of confrontation for nearly five long decades. The yield has been nothing but tension and conflict. The people have not benefited in any way. In these wasted years other countries, especially in east Asia, have gone far ahead both in material progress and in human development. These very fruits could be ours also if only the governments of Pakistan and India were to honour the wishes of the people.

In the absence of peace and friendship, the foreign policies of both governments in relation to each other have been heavily militarised. In essence these are no more than defence policies, formulated on the basis of mirrored threat perceptions, each government treating the other as its chief adversary. The enemy's military capability has had to be constantly matched, preferably outmatched. The resultant arms race has burdened both countries with massive, wholly unaffordable, defence budgets. It has also made both governments aspire for nuclear weapons status, without a thought for the nightmarish consequences for the people. The military-nuclear lobbies in the two countries have come to dominate relations between Pakistan and India.

Domestic policies too have not remained unaffected by militarisation. Independent India started with just two battalions of armed police at the centre; it now has over 400 battalions spread over numerous paramilitary forces. It has armed itself with draconian laws, the most notorious being TADA. It uses the army in domestic situations with alarming frequency. The coercive arm of the state that these instrumentalities constitute has been freely used not only to suppress ethnic and other uprisings but against the minorities and disadvantaged sections. Punjab, Kashmir and the north-east have become virtual police states. Large tracts elsewhere are not far behind. The rule of law, human rights and democracy itself – all are under severe threat.

Pakistan has had the misfortune of being ruled by military dictators for 22 years. Of these 15 were under martial law, often extremely oppressive and brutal. After 1988 democracy has resurfaced, but there are barriers still to be overcome. Some of the restrictive laws and constitutional amendments enacted by Zia ul-Haq which violate the Universal Declaration of Human Rights have yet to be replaced. The tribal and feudal structure of Pakistani society provides fertile ground for the exercise of arbitrary power outside the pale of law. It thus constitutes a serious hindrance to establishing a truly democratic dispensation accountable only to the people.

In both India and Pakistan much needs to be done to protect the lives and honour of citizens, especially women, children, the poor and other weaker sections. But in both countries the assumption has prevailed that if only the coercive instruments of the state could be further strengthened the so-called law and order situation would improve. Armed with immense power to misrule, the ruling elites are now able to combine business with politics and politics with business. The apparatus of the state, in collusion with them, is able to oppress, exploit, perpetrate any crime, violate any law and go unpunished. Such are the wages of militarising domestic politics.

A militarised, or even semi-militarised, polity becomes a breeding ground for undemocratic forces. Both Pakistan and India have witnessed the rise of religious intolerance in recent years; Islamic fundamentalism in the one case and Hindutva extremism in the other. Short of outright military dictatorship, militant communalism is the most lethal for civil society. For it generates social strife and increases the persecution of disadvantaged sections, especially among the minorities. Consequently religious intolerance must be curbed at all cost. Otherwise there could be a re-enactment of the contemptible demolition of the Babri masjid and the unspeakable outrages of Surat and Bombay,

as also the mindless destruction of temples in Pakistan and Bangladesh and the deadly bomb blasts of Bombay.

Kashmir has had to suffer the militarised policies of both India and Pakistan. India has suspended democratic governance there and imposed rule by the army and paramilitary forces. Pakistan has not hesitated to train, arm and infiltrate militants for its own ends. Both have acted on the premise that Kashmir is merely a territorial dispute between the two of them. Neither seems able to see that a peaceful democratic solution involving the peoples of Jammu and Kashmir is the only way out. Such a solution is essential for promoting peace in the subcontinent.

For peace to be promoted the policies of the two governments, both foreign and domestic, will have to be shorn of militarisation. Only then will it be possible for the democratic voice of the people to be heard. Thus peace requires the strengthening of democracy in both countries. Not just feudal democracy as in Pakistan or elitist democracy as in India, both marked by gross corruption and abuse of power, but grass roots democracy which enables the mass of the people to share power, impact policies and enforce accountability. Conversely democracy needs peace through the elimination of militarism in both countries, both external and internal. Peace and democracy go hand in hand. History records no instance of two genuine democracies having gone to war against each other.

If the two people's cry for peace and democracy can lead to a solution of Kashmir and the reduction, if not eradication, of religious intolerance these would be dividends enough. But if the people's demand were also to result in an unconditional no-war pact immediately, without yielding to any third party pressure, there would be the inestimable dividend of freedom from fear of war. And if it were further to compel denuclearisation, the dread of total annihilation would go. If it were simply to commence a significant cutback in defence expenditures, there would be resources enough to meet the genuine needs of the people.

In an atmosphere of peace and friendship, the border between the two countries could be opened. The peoples of Pakistan and India could then begin to re-discover each other. Trade barriers could be lowered, or better still removed, fetching incalculable gain to both sides. There need be no room thereafter for the multi-billion dollar clandestine trade that is there at present. Pakistan and India would mount the first rung of the ladder to prosperity and well-being for all their citizens. Above all the two great countries would stand together rather than be ranged against each other in world forums.

These broadly were the issues and concerns a convention organised by the Pakistan-India People's Forum for Peace and Democracy discussed in New Delhi on February 24/25. Around 200 delegates in roughly equal numbers from the two sides participated. It was the largest such gathering till now. Its wholly non-governmental character and its squarely political agenda clearly distinguished it from all previous exercises.

The biggest gain of the convention was that it was held at all. To everyone's surprise the Indian authorities gave the necessary visas to the visiting delegates and the Pakistani authorities did not stop them from coming. Both sides opened their hearts and minds in an atmosphere of warm friendship. What came through was an earnest desire to bury the hatchet once and for all. Equally impressive was the yearning on both sides for truly democratic governance. Some kind of chemistry was at work which made the delegates feel that perhaps they were making history. There were no illusions about the difficulties ahead but the occasion was seen as the beginning of a turnaround.

The area of agreement was considerable. There was common ground that war offered no solution and further that nuclear weaponry

made no sense. Following this a call was made for a reversal of the arms race between the two countries as also for the elimination of all nuclear weapons from the face of the earth. Both sides were categorically opposed to religious intolerance. They demanded truer democracy, with the accent on accountability, decentralisation and concern for, and protection of, all disadvantaged sections, especially the minorities, the poor, women and children. On Kashmir the delegates agreed that the aspirations of the people had to be taken account of. They called upon their two governments to take positive steps to promote peace and tranquillity and establish democratic process on both sides of the line of control.

The convention decided to reassemble in Lahore around October 1995. Between now and then, the delegates pledged to spread the message of peace and democracy far and wide in their respective countries. Amongst the measures suggested to open communications was one sure to gladden millions of Indians and Pakistanis, the immediate resumption of cricket tours.

The conclusions of the convention deserve the support of all right thinking people in both countries. The two governments would do well to pay heed to them.

atrocities by Indian security forces are equated with the demand for condemning excesses committed by militants. Abuse by the militants of their responsibility as wielders of guns is condemnable, but it has neither caused nor fuelled the alienation of the people. The unwillingness to admit that popular rebellion in Jammu and Kashmir was brought on by New Delhi's corrupt and authoritarian ways has meant that no interrogation takes place of the premise which locates the fault in Pakistan's "continuing desire to define political and territorial identities on the basis of religion". The fact is that the vivisection of British India created two nation-states, and when the wheat is removed from the chaff it becomes clear that the Indian nation-state too defines itself in terms of cultural markers of religious exclusivism.

The Indian government, by all reckoning feeble, is not too enfeebled to handle a Bal Thackeray, yet the Indian government let Bal Thackeray sabotage a cricket series with Pakistan and allowed him to stop the hosting of the Pakistan Day celebration in Bombay. Surely there must be a logic in this indulgence of criminals. The reason is that the jingoistic display was said to represent popular reaction to Pakistan's involvement in 'terrorism'. Sure enough, Pakistan closed its consulate. My encounter with an official in the ministry of external affairs provided further corroboration. The appointment lasted nine minutes since I did not ask any question about Pakistan's role in fomenting 'terrorism' in India. The heightened atmosphere of tension enables the concentration of powers at the expense of people's interests and rights. Despite popular revulsion against the tyranny of TADA, the black law survives. Such a state of affairs results in burgeoning military and police expenditure, which in 1994-95 exceeded Rs 35,000 crore, nearly a quarter of the expenditure budget of the GOI of 1,57,000 crore. Concomitantly, restrictions are placed on travel and communication which jeopardises the right of tens of millions of Indians who have relatives and friends in Pakistan, not to mention thwarting mutually beneficial trade. Two-way trade stood at Rs 39 crore in 1982-83 and rose to Rs 525 crore in 1992-93. Unofficially it is claimed that Indo-Pak trade turnover is at least Rs 1,600 crore and could exceed several thousand crore. Despite SAPTA, signed in April 1993, and GATT, Pakistan allows only 575 items to be imported from India. One reason could be common items of foreign trade between the two countries; another reason, the presence of a strong lobby against trade with India in Pakistan. As a result, Pakistan imports wheat from Australia and the US rather than from India, the same is true of coal and cement. Conversely India does not import natural gas, cotton, sugar, etc. from Pakistan. With increasing difficulties encountered in acquiring visas, there remain major bottlenecks despite a more than 15-fold increase between 1982-83 and 1992-93.

PAKISTAN-INDIA RELATIONS

People's Initiative

An Idea Whose Time Has Come

Gautam Navlakha

Like Hanibal crossing the Alps who, when his elephants' paths were blocked would light a fire around rocks and then pour water on them to crack them open, the deadlock between India and Pakistan can only be prised open by a non-governmental people's initiative.

WHEN Hanibal crossed the Alps and his elephants' paths were blocked, he would light a fire around the rock and pour water on it so that the rock would crack open. Since the ruling circles of India and Pakistan define themselves by confrontation with each 'other', the resultant deadlock can only be prised open by a non-governmental people's initiative between people of the two countries.

It is true that the Pakistani government uses anti-India rhetoric to deflect attention from its own anti-people politics, but the Indian government is no different. Struggles of landless and poor peasants, dalits, tribals, and Naga and Kashmiri people have emerged from the soil of the Indian nation-state, but the tendency is to present them as acts of 'terrorism' linked to the ubiquitous ISI. For the rulers this makes perfect sense since fighting poverty has been replaced with negotiating cultural identities. When these

cannot be co-opted through usual means, law and order becomes the norm. This introduces the momentum which leads to the emergence of 'terrorism'. To justify recourse to extraordinary violence, it requires not only a demonic enemy but also to represent the Indian nation-state in a favourable light so that its defence becomes a worthwhile enterprise. Therefore Pakistan is presented as a monolithic theocratic state, dominated by the military and ISI, a base for US imperialism or now Islamic fundamentalism, and in possession of nuclear warheads. In contrast, India is projected as a secular state notwithstanding the persecution of minorities; civilian control over the military is highlighted but not the militaristic approach to dealing with popular movements; the Indian ruling classes' self-serving nationalism is translated into anti-imperialism; and nuclear ambiguity is accepted at face value. Consequently, in the dispute over Kashmir,

The prevailing mood among the decision-makers, interrupted by the exigencies of assembly elections, is to hold talks when there is considerable outside pressure, but to offer nothing substantive to resolve disputes. Some time ago, Pakistan's high commissioner told an interviewer that the Indian foreign secretary gave an assurance in 1993 to his Pakistani counterpart that India was ready to discuss the Kashmir issue with Pakistan provided Pakistan withdrew its resolution on human rights at the UNGA, but nothing came of this. He also mentioned the assurance given on September 3, 1981 that Jinnah House in Bombay would be given to Pakistan as the residence for their deputy high commissioner; nothing was done. Similar backtracking can also be gauged from accounts of the last round of foreign secretary level talks held in Islamabad, January 1-3, 1994.

It was the Pakistani prime minister who took the initiative in August 1993 to propose the revival of bilateral negotiation in terms of Article 6 of the Simla Agreement, which calls for a "final settlement of Jammu and Kashmir". The Indian response to that was that negotiations cannot take place under a single clause and must be held under the totality of the Simla Agreement. Stated simply, the Indian position is that Zulfikar Ali Bhutto had agreed to recognise the Line of Control (LOC) as the international border but had in 1972 needed time to win domestic concurrence for the same. They point out that the agreement debars the two sides from changing the LOC by use of force, and accuse Pakistan of attempting to do so through the support of terrorism and secessionism in the valley. The Indian government has also insisted that Pakistan's support for the UN resolution will make India's stand more rigid. The Indian approach was to emphasise that Pakistan is fanning controversy on Jammu and Kashmir merely because it has an ideological bias against secular politics, and to give the impression that it is more keen to ease tension. Therefore it is argued that the two countries ought not to look at their relations through the prism of a single issue and should move towards resolving other issues like Siachen, Wullar Barrage, Sir Creek, nuclear non-proliferation, etc. With little happening on the decisive issue of Kashmir there is no incentive to end recriminations over Siachen and Sir Creek. Senior government leaders admit that "there was only one problem", i.e. Kashmir, between the two countries, and if this problem could be addressed properly all other issues could be resolved.

The Pakistani government rejects Indian claims and says that if there was an understanding reached in 1972 then neither the minutes nor any other records lend weight to such claims. They argue that this insistence on the "totality" of the agreement is a way to maintain the status quo and to restrict

the bargaining weight of smaller countries. They point to the indigenous roots of militancy in Kashmir while stressing that Kashmir is a disputed territory recognised by the international community. They also insist that India agreed to this meeting in an attempt to escape inter-national opprobrium over atrocities being committed in Kashmir.

Whatever the rationale, the Indian government's insistence on bilateral talks as a means to resolve disputes with its neighbours is a lemon from which all juice has been extracted. Twenty-four years of bilateral talks with Bangladesh on sharing of river waters, or forty-five years of bilateral talks with Nepal on a trade and transit treaty, have not brought the two sides any closer to a solution. Even in Jammu and Kashmir, the GOI has been opposed to third party intervention, although it was India that took the issue to the UN. In 1948 the UN Commission on India and Pakistan negotiated the ceasefire leading to the introduction of a UN military observer group for India and Pakistan. But in 1971 in the negotiation of the ceasefire they had no role to play, and the GOI took a policy decision not to deal with them. Now the foreign ministry has accepted the proposal that once in a while UNMOGIP be contacted by Indian army brass. This is of course a small concession to ward off bigger pressure. Lest we forget, the UN secretary-general in his 1994 report mentioned that relations between India and Pakistan are "marred" by the dispute over Jammu and Kashmir, "one of the oldest unresolved conflicts on the UN agenda". While noting their resolve to solve their problems bilaterally he added, "Nonetheless the level of tension in Jammu and Kashmir has increased considerably in recent years". Pakistan has formally requested the secretary-general to increase its strength from 35 to 200 and extend its mandate to monitoring the situation in the valley in addition to the LOC.

However, India has rejected Pakistan's suggestion that a neutral force monitor the LOC to verify that no crossing of the LOC takes place from their side. But if trans-border terrorism is an acute problem then international pressure can help in reducing infiltration. Instead the Indian government implies there is no need for independent corroboration that Pakistan is waging a "proxy war" against India in Jammu and Kashmir. Since fighting even a "proxy war" necessitates the fanning of hysteria, it has a bearing on domestic politics.

Such a political ambience suits the US and EU to extract maximum advantage for themselves in IPR, NPT, entry into infrastructure sectors, GATT, etc. Let us remember that there is a consensus between the US, EU, Japan and Russia on giving themselves through the UN an interventionist role on wide-ranging issues. Not surprisingly, these countries have turned human rights into an enterprise which yields a commercial

harvest. Now that the big powers have linked the Indian candidacy for a permanent seat in the UNSC to improvement of relations with Pakistan as well as ending atrocities in Kashmir, there is even greater need for substantive measures by GOI.

JAMMU AND KASHMIR

The Indian bourgeoisie, ruling or in opposition, insists that Jammu and Kashmir must stay part of India. Some feel the need for negotiations with Kashmiri leaders, but most argue that a secession could start the stalled engines of disintegration. For good measure, mention is made of retaining Jammu and Kashmir for the very survival of secularism in India; this informs the opposition to the right of self-determination for Kashmiris. Much is therefore made of popular fatigue and the shenanigans of militants. The futility of envisioning settlement within the Indian union escapes perceptive observers who naturally fail to appreciate the cause of alienation and the justification for demanding self-determination. No wonder they remain unmindful of the touch-and-go nature of the situation in the valley.

On the night of December 18 a missile was fired towards Pamposh Hotel, on the northern shores of river Jhelum, used as a temporary barracks by the CRPF. The missile missed its target and fell in Pratap Nagar colony, destroying houses, shops, cars, and bathhouses. The unusual thing was that damage took place in a six km area and created a six foot deep crater. The force of the impact suggests that the missile accidentally hit an ammunition dump of the BSF which has barracks in the residential colony of Pratap Nagar. While no human life was lost, what this incident brings home is how close one is to a catastrophic accident in the valley. While uncertainty hangs over the people, the IG of jails in J and K has demanded money to build new jails to house 11,000 TADA/PSA detenus in the state. This is in spite of military intelligence confirming that detention without trial and third degree interrogation have not reduced militancy, and that jailed people come out more committed to their cause.

Of course it is claimed by the Indian government that militancy has been curtailed and the human rights situation improved. But at Laras Jagir village in Tral, security forces torched 18 houses, killed a 50-year-old man and molested four women. A similar incident took place in Anantnag where 17 houses and four godowns were set ablaze. While the occupation by militants of the shrine of Charar Sharif highlights the tenuous hold of the Indian forces, the declining morale of the troops can be had from the decision of the army to weed out "chocolate eating" personnel from the field of operation to prevent them from pursuing a policy of "live and let live". But the GOI's upbeat mood is subsumed by cold statistics; in the past

five years 11,522 militants were arrested, 6,147 of them detained under PSA and the rest under TADA. Obviously persecution is preferred over prosecution. The director-general of police M N Sabarwal said recently that in the past five years, 9,599 persons were killed, of which 5,118 were militants, 1,446 were security personnel and the rest civilians. To enable the security forces to undertake such tasks in defence of unity and integrity, Jammu and Kashmir spends Rs 185 crore annually on 'security related activities', and funds to the extent of Rs 400 crore are diverted from the plan to the non-plan side. Little is done to end 20 hours of power cuts in the valley in chilling winter.

The inefficacy of the military approach becomes even more clear from the political antics of the GOI. At the intervention of the Indian ambassador to the US and the US embassy in India, Mirwaiz Moulvi Farooq and Moulvi Abbas Ansari were permitted to travel to Casablanca for the OIC summit. By excluding Abdul Ghani Lone, considered too close to the US, and permitting the other two leaders from Hurriyet, the Indian administration expected some advantage in the valley where Indian officials desperately search for dialogue partners. The fact that Shabir Shah and Yasin Malik rejected attempts to be roped in and even the Jamati-Islami kept itself out, shows that those who matter remain beyond the reach of New Delhi. An alienated people have repeatedly shown their desire for a peaceful solution. They have thrown up leaders who have provided a democratic voice to their aspirations, refusing to compromise on the core matter of self-determination. Despite decimation the JKLF survives and Yasin Malik has shown a willingness to reach out to the Indian public. Recently released, Shabir Shah has been travelling in different parts of Jammu and Kashmir holding meetings. He has called for the merger of all groups into one organisation, and a code of conduct for all militant outfits "in order that gun toting criminals are identified and the sanctity of the movement restored". He also advocates a united policy on the issue of Kashmiri pandits "so that the problem is speedily resolved", and has called for the "free functioning of intellectuals, writers and journalists and their associations". He castigated Hurriyet for being silent when "our own people are shedding our own blood. The pockets of the weak are being cut. Free expression is banned and the pen is mortgaged." But he reiterated that the only solution is to allow the people of entire Jammu and Kashmir to exercise their right of self-determination. With the return of Mohammed Azam Inquilabi, head of Operation Balakote in Srinagar, battle has been joined for political assertion with those who see the gun alone as the means to win freedom. He declared in his very first

statement that "it is time to shed the gun culture and rededicate ourselves to democratic struggle", and is convinced that "if we demand our right democratically it will be heard". While militants are taking the Indian public seriously, the political assertion of militancy is read as a victory for Indian hardliners.

THE INITIATIVE

It is against this background that the need for an initiative by people was felt. The crass pragmatism reflected in the Indian debates, unable to go beyond the stereotype of a war/peace scenario, was incapable of bold and courageous ideas in defence of the people of Jammu and Kashmir or understanding the strategic significance of democracy for the two people. There was also the urgency to have an informed public opinion which can blunt the edge of prejudice which masquerades as patriotism. Efforts towards this began two years ago and really got off the ground in May 1994 when the first parley took place at Lahore. Starting with a few individuals and two preparatory meetings – first in Lahore in September last followed by the other in Delhi last November – the agenda was worked out. It was self-consciously non-sectoral – trade union, women's rights movement, environmentalists, etc. The very

name – 'Pakistan India People's Forum for Peace and Democracy' – stressed the difference from earlier efforts. This forum felt that peace and democracy are indivisible, and therefore the need of the hour is not just ending war and warlike preparations but ensuring the restoration of people's rights and just and fair governance as behoves civilised societies. On the political agenda, four subjects were identified: war and war hysteria and the need for de-militarisation; religious intolerance, minority rights and threat to democracy; the Kashmir dispute; and the role of governance.

Those engaged in semi-official/third party mediated conferences were consciously excluded. If it was to be true to its name, then involving people through the aegis of non-governmental movements, struggles and groups was essential, and this became the basic criterion for the selection of delegates. With 96 delegates from Pakistan and 115 from India, this became the first-ever people's conference between the two countries, which in itself is significant. The free and frank discussions were an exhilarating bonus. It was decided to hold the next conference in Pakistan sometime in autumn, meanwhile the organising committees would hold meetings in different towns to discuss the recommendations arrived at by the delegates.

CPI(M): Ideological Renewal Given the Go By

Ajit Roy

That the CPI(M) does not set much store by the renewal of its professed ideology is proved by the absence of critical assessment of the developing reality, internationally and nationally, in the draft political resolution adopted by the party's central committee for finalisation at the 15th congress of the party to be held at Chandigarh next month.

WITH the conclusion of the state party conferences, the CPI(M) is now focused on its international and national political positions. The draft political resolution adopted by the central committee for finalisation in the 15th congress to be held at Chandigarh in early April deserves critical attention because of the party's considerable role in national politics.

The present draft marks an improvement in the party's writing style. It is less prolix, although the old irresolution in making a stylistic choice between a report and a resolution still persists.

The first, and the shorter, part of the two-part draft deals with the international situation. Although three years have elapsed since the previous congress, the party does not seem to have made much progress in

the critical evaluation of the basic causes behind the collapse of the old system in the USSR and its east European neighbours. The ideological document presented at the previous congress in January 1992 had given a somewhat tentative analysis of the previous developments, accompanied by many self-critical statements about the party's naivety, that it had been uncritically influenced by received ideas. The document had stressed the need for more in-depth knowledge. The present draft, however, does not indicate that the party has made any significant advance in that direction. For example, while correctly nailing down many of the specific sins of Stalinist practice, the previous document still tried to balance the negative with 'the positive'. The present draft does not broach the subject

at all. It makes no attempt to re-understand in depth either the rich experience of the 70 years of history, dominated as it was by the direct and indirect impact of Stalin's handiwork, or to derive guidance for the present and the future on the basis of this enriched understanding.

That the CPI(M) does not set much store by the *renewal* of its professed ideology is proved by its mechanical repetition of old categories and concepts rendered useless and irrelevant by the march of history. For example, its entire analysis of the contemporary world politics is still dominated by the old concept of four basic contradictions, the first and most important of which is considered to be the contradiction between the imperialist and socialist systems. To the CPI(M), it appears, the collapse of the old system in the USSR and its east European allies does not make a fundamental difference, nor does it notice the fundamental metamorphoses in China and Vietnam, the other two leading constituents of the world socialist system – the two changes which between them render the so-called socialist system a myth.

In the very recent postscripts to his classic account of the Vietnam war (*Anatomy of a War*) Gabriel Kolko, a long time admirer of the CP of Vietnam, has given exhaustive details of its new policy orientations and their consequences. He has shown how the present policies of the regime have been leading to a steady impoverishment of the poor and, more significantly, disempowerment of the poor peasants, the party's traditional social base, spreading hunger, disease, unemployment, social and regional polarisation, much aggravated by corruption, nepotism, bribery and frauds, reaching up to the top. So much so that the World Bank, the new patron saint of the regime (and the Asian Development Bank) has from time to time issued mild warnings. The constant mouthing of 'Marxist-Leninist' phraseology by the party leadership is apparently motivated by its concern for its legitimacy in the face of growing disillusionment and even incipient rebellion of the ranks and masses.

Though no one, to my knowledge, from among confirmed Marxist supporters has so far studied the present Chinese scene with such meticulous care, all available evidence suggests the operation of the same basic trends there, obviously with the same results.

With the old communist regimes doing their very best to generate grave contradictions with their professed aims and objectives in their own backyards, any contradiction with world imperialism is superfluous and can be only of a nominal importance.

Whatever the positive significance of the survival of the old regime in tiny Cuba and North Korea, the concept of contradiction

between the two *global* systems is a self-deception.

Another notion, uncritically carried over from the past, is 'nonalignment' in the international sphere. As is well known, this concept was born in the context of sharp confrontation between the two superpowers in the post-second world war era. Gradually diluted in content, due to many historical developments, it has lost its meaning altogether with the emergence of the so-called unipolar world. What is in prospect is the emergence of a global alignment against the domination of the OECD bloc led by the US. Evocation of the old and irrelevant concept does not sharpen the focus on the looming task.

Another important shortcoming of this part of the draft is the failure to draw an important conclusion from the phenomenon of the world domination of the TNCs which it deals with in some detail. Specifically, it fails to note the loosening of the TNCs' national anchorage and greater proneness to shift employment and investments abroad in quest of higher profits. This fact is leading to a radicalisation of the working class and segments of the population of the metropolitan countries and thus laying a firmer basis of international actions by popular forces.

Coming to the second, national, part, while one can agree with and welcome the general thrust of the draft in broad terms, one cannot help notice the absence of critical assessment of the developing reality.

For instance, while the draft rightly focuses on the menace of communalism, it misses the new and more menacing element in Hindu fundamentalism today. Although it passes under a common label, India has really witnessed two distinct varieties of communalism: (i) a sectarian movement bargaining within the existing polity in the interest of a particular community of the people, and (ii) a bid to go beyond the existing polity and impose violently a fundamentally different polity on the country, as the Pakistan movement did in the 40s. The present phase of Hindu fundamentalism, represented by the 'Sangh parivar', belongs to the second variety and, hence is a grave threat to the existing democratic order whatever its limitations. Indeed, this brand of communalism has become the rallying ground of various retrogressive social forces for imposing an authoritarian regime. In this context, along with traditional anti-communal campaigns based on religious tolerance and amity, a comprehensive programme of grassroots democratic forces has become very important. It is not enough, as the present draft projects, to combine economic struggles with struggles against communalism. What is needed is a pervasive and integrated awareness and commitment to ideals of human rights, ethnic plurality, social equity and grass roots participation in decision-making

processes. From this standpoint, the present official programmes of so-called panchayat raj needs a second look. The ongoing panchayat programmes have no doubt broadened the power base, but up to a certain level only. They have also relatively empowered the middle caste landed interests, whose oppressive pressures on the landless dalits and adivasis have not weakened much, if at all.

Before we come to our last major critical point, some sundry issues. The party has not freed itself from its ultra sensitivity about (military) national defence which is still a holy cow for it! There is not a word about the burden of the unconscionably high military expenditure, open and hidden. Secondly, the party has not given up its commitment to the demand for the repeal of Article 356 despite the new safeguard provided by the recent Supreme Court judgment and the observed role of the BJP state government in Uttar Pradesh in the Babri masjid demolition.

A far more serious analytical shortcoming of the draft, however, is in its understanding of the so-called New Economic Policy (NEP) which is supposed to have been initiated by Narasimha Rao and Manmohan Singh under pressures from the World Bank-IMF. It thus ignores the internal secular compulsion generated by the accumulated consequences of the Nehru era. It also fails to note that some of the main elements of this policy had actually been coming into effect without any articulated policy frame since the mid-70s. More importantly, it fails to note the crucial fact that this policy has been able to consolidate behind the ruling power bloc the support of a large segment of the population, variously estimated at 15 to 25 per cent of the total, by bringing as it does rich dividends, at least initially, to a broad spectrum stretching from top industrialists through substantial farmers to a sizeable part of the middle classes. All this has serious implications for strategies and tactics of political mobilisation in the present and coming periods.

Most importantly, while the draft resolution is highly critical, and rightly so, about the NEP and its impact on national life, it is absolutely silent about Jyoti Basu's crusading zeal about many of the main elements of this policy in West Bengal. This cannot be explained in any manner except as a piece of blatant opportunism.

Finally, although its West Bengal branch is by far the most important part of the party and although the entire activity of this state branch is principally centred on the Left Front government that it leads, the draft resolutely refuses to reflect upon the party's performance in this realm, even though there is widespread perception of the creeping degeneration of and corruption in the party that have arisen from this connection.

World Archaeology Congress

Unravelling Deceit

GN

For those who retain the illusion that there is a difference between the lumpens who demolished the Babri masjid and those who provide the intellectual input for bigotry and xenophobia, the goings-on at the World Archaeological Congress-3 come as an eye-opener.

THERE are many who still retain the illusion that there is a difference between the lumpens who demolished the Babri masjid and those who provide the intellectual input for bigotry and xenophobia. The goings-on at the World Archaeological Congress-3 came as an eye-opener. The Indian organisers of WAC-3 fought first to ensure that there was no discussion of the Ayodhya issue at the congress, and when exposed used every trick to thwart a general resolution being passed condemning the demolition of Babri masjid and manipulation of evidence by archaeologists. In the process, the machinations of pseudo patriots besmirched the country's honour and earned a bad name for India's archaeologists and historians.

Office-bearers of the academic committee for WAC-3 chose to use the easiest course of action – making the foreigner feel that his or her action could trigger off a chain of events that could lead to riots and deaths. There is scarcely anyone who wants to carry the guilt of having caused the deaths of innocent people. As a result, on December 4, the day delegates were to arrive and register, a statement was distributed to all participants in WAC-3 which informed them that the WAC executive supported the “views of our Indian colleagues that there should be no papers or discussion at meetings of the executive/council and in plenary session on the politically and communally sensitive Ram Janmabhoomi-Babri masjid (Ayodhya) issue”, adding that the “practical consequences of discussing this issue would be beyond the executive's control”. This statement, signed by the outgoing president of WAC Jack Golson, concluded by saying that “this is the only concession that it (WAC) is willing to make to limitation of the WAC principles of discussion of the historical and social role, and political context, of archaeological enquiry and interpretation”.

Delegates were predictably furious. Some felt that were WAC-3 to disallow a discussion and adoption of a resolution

condemning the destruction of the 16th century Babri masjid and those archaeologists who supported or participated in vandalism, this would be violating the very fundamentals of the discipline. Others felt disturbed by the fiat disallowing discussion. Several Indian participants demanded to know what was meant by the “practical consequences” to which Golson refers. No explanations were forthcoming.

Once the organisers realised that Golson's letter, instead of putting a lid on discussion was generating one, they panicked. In a move designed to evade responsibility, an RSS front, Historians Forum, issued a statement blaming the HRD minister for curtailing a discussion on Ayodhya. This embarrassed the government, especially the HRD minister who has gone about cultivating his image as a saviour of secularism, never mind that his government had facilitated the destruction of Babri masjid. Obviously, for political tightrope walkers, image projection is crucial. The president of the academic committee B B Lal was summoned to the ministry and compelled to issue a statement contradicting the Historians Forum and denying that the government had anything to do with the decision. That they could twist B B Lal's arm raises the question as to why the ministry did nothing for two years about the composition of the academic committee. But B B Lal's statement once again caught the organisers on the wrong foot. They had told Jack Golson that dropping the Ayodhya issue from discussion was at the request of the government. It was probably this that led Jack Golson to circulate a seven-page statement giving the sequence of events, which shows the deceitful conduct of the Indian organisers.

On November 30 the secretary-general of WAC-3, V N Misra, head of Deccan College of Archaeology, requested Golson on behalf of B B Lal, the president of WAC-3, that the Ayodhya issue could not be discussed as “an essential part of a commitment... made in the presence of the minister of Human Resource

Development”. V N Misra, a senior scholar, also communicated that failure to abide by this commitment would have “incalculable consequences for WAC-3, including possible externally inspired disruption”. In private Golson was told that were WAC to disagree, the government has threatened to withdraw police protection. Golson was warned that the Indian committee would wash its hands of the entire congress. This was pure and simple blackmail and Golson succumbed to it. However, Golson's draft announcing the WAC executive's capitulation was found to be inadequate, and a draft prepared by B B Lal was given for Golson to sign which committed WAC not to discuss or pass a resolution on the “politically sensitive” Ayodhya issue. Golson says “I refused to do so until I had consulted the WAC executive”. The executive met and complied with “Professor Lal's imposed deadline of 5 pm” on December 1. It was also decided that a statement of this decision would be provided to the participants, and a statement was prepared by the executive. But once again V N Misra and Makhan Lal disapproved of the contents and insisted on revising it. “This revised version was later distributed” to the participants.

Significantly, Golson's statement is also an indictment of himself for being weak-kneed and for failing to see that the issue of Babri masjid was not a minor issue of local importance, just as the persecution of Jews by the Nazis in the 1930s was not. He points out that some of the people he talked to denied that any commitment was made in the presence of the HRD minister in early November. Why did he then choose to believe B B Lal? Why did he not respond even when, after the inauguration, the minister told the press on December 5 that he had never opposed a discussion of Ayodhya at WAC-3? In fact, why did he not ask the minister during the inaugural function why in world's largest democracy the government forbade discussion of the Ayodhya issue? This does not mean that the central government favoured a discussion either. What Golson does not mention but said in private was that he was shown a letter purported to have been signed by the minister asking for such a commitment. Was that letter forged or did the minister really sign this letter? Only a month back the minister had persuaded some historians to agree to join the academic committee of WAC-3, arguing that it was a matter of national pride that such a congress was being held in India. A discussion on the demolition would be tantamount to washing dirty linen in front

of outsiders. The very idea outrages self-serving patriots. After all, it also helps to divert attention from the government of India's culpability in the crime committed on December 6, 1992. However, on balance organisers had a lot more at stake and therefore to lose from a discussion and adoption of a resolution by WAC-3 that condemned them compared to the central government. It is this that explains their act of desperation.

Reminiscent of the attack by RSS goons on media persons on December 6, 1992, the secretary-general of WAC Peter Ucko was threatened with dire consequences by one of the Indian organisers were he to push for a discussion on the Babri masjid issue. Not content with this and in order to take care of contingencies, once it became known that some delegates were determined to push for a resolution the organisers refused to announce the time and venue for the plenary session. Word spread that Indian organisers were planning to have the plenary in the evening of December 11 to ensure that most foreign participants would be busy planning their departure. Finally on the evening before the participants were informed that the plenary would be at 11.30. When the delegates reached the place they found a note informing that the plenary has been postponed till 1.30 pm instead. At the plenary session, as soon as R S Sharma got up to read out the resolution proposed by 18 scholars, as if on cue screaming and shouting started. Then began a free-for-all which was presumably designed to waste time and enable B B Lal to announce that a vote on this resolution is not possible since several non-delegates have entered the hall. Before anyone realised what had happened, he declared the plenary closed. By the time Jack Golson walked up to speak, he found that one of the Indian organisers had switched off the mike. While the Indian organisers managed to subvert the plenary, the disgusted delegates compelled the new executive council of WAC to adopt this resolution and thereby managed to salvage some of the ground lost due to the machinations of the organisers.

The deceitful actions of the organisers were compounded by the insulting treatment of Indian delegates who were treated like cattle, left to fend for themselves. There was no one to receive them at the railway stations, and they were put up in tents in winter in Delhi with no facilities. Unlike other delegates who were given all the papers, they were asked to fork out Rs.250 if they wanted the set of papers. So gross was the mismanagement that sessions were changed and re-changed and delegates and people who were to

present papers were found running back and forth to find where various sessions were being held. In fact the organisers practised apartheid to the extent that Indian and non-Indian scholars were to read papers at separate sessions and not according to the themes covered. At the last minute the WAC executive insisted that this be changed since this defeats the very purpose of interaction among fellow archaeologists. What is worse, several foreign delegates complained that they received no acknowledgement for the advance amount varying from \$ 150-200 that they had sent. In fact in several cases delegates were asked to fork out money claiming their bank drafts had not been sent. In one case a Spanish delegate who had sent the money in July last was told that there was no hotel accommodation for her since her money did not arrive, and she was left to fend for herself.

While WAC-3 left a bitter after-taste for the organisers, it was self-inflicted. However, to the extent public funds were provided for WAC-3 the public has a right to demand an explanation from the organisers. Those who decided not to boycott the congress and in fact were even willing to be co-opted into the academic committee were banking too much on the benevolence of the government for their ideological battle. Far too much time was spent in complaining to the government about misappropriation of funds and suggesting that R S Sharma and Irfan Habib be accommodated instead of Makhan Lal and S P Gupta. Certainly when it came to the crunch, it was the stiff

resistance put up by scholars both inside and outside that drove home the point that in opposing the organisers one was fighting the forces of reaction. The experience of WAC-3 makes it clear that one cannot waffle when confronting communal-fascism.

Sadly, while allocations for universities are being curtailed generous grants were made available to a bunch of people whose commitment to their discipline was in doubt even when their competence as manipulators was not. In fact WAC was to be the vehicle to gain respectability for the act of vandalism in Ayodhya. Once it became clear that WAC was inclined towards adopting a resolution condemning the demolition of Babri masjid, they used tactics that would do fascists proud. However there is some benefit that has come out of all this. Scholars linked to the RSS and their supporters did a good job of establishing that they are misfits in civilised intellectual circles. It is also clear that those who depend on the government to fight their ideological battles should think twice now about a government which runs with the hare and hunts with the hound. It is also time to ask why allocations for universities decline while the size of the discretionary funds at the disposal of the government keeps on increasing. Finally, to treat RSS fellows as gentlemen/women who play by the rules is to forget the diabolical character of their ideology. The gloss of scholarship, just as the mantle of patriotism, is a thin veneer which at the slightest provocation exposes its heinous side.

Meonis of Mewat

Yoginder Sikand

The Meos are descendants of rajput, meena and gujjar converts to Islam and are scattered over a large area south of Delhi towards the Thar desert. The condition and status of the women in this poor community largely made up of small and middle peasants is distressing. Not only are they educationally backward, with few opportunities to attend schools, but are subject to customs which contribute to keeping them economically and socially backward.

STRETCHING southwards from the border of Delhi towards the Thar desert, over large parts of Gurgaon and Faridabad districts of Haryana and Alwar and Bharatpur in Rajasthan, is the culturally distinct region known as Mewat. This name is derived from the major community inhabiting this area, the Muslim Meos. The Meos are descendants of rajput, meena and gujjar converts to Islam. It is estimated that there are over a million Meos in Mewat alone, and several hundred thousand scattered elsewhere. Nearly all the Meos of Mewat reside in the rural areas, and most villages in the region have overwhelming Meo majorities.

The Meo community consists almost entirely of small and middle peasants who, on the whole, are greatly impoverished. There is an almost complete absence of irrigation facilities in the region, and this is so even though the present minister of state for irrigation in Haryana is himself a Meo. As a result, most Meos can raise just one crop a year, and that only if the rains are sufficient. Rampant exploitation by bania and Jain moneylenders is another major cause of Meo poverty. Most of the banias of Mewat (there are a couple of them in each Meo village and bania majorities in most Mewati 'qasbas' or small townships) live off the interest they charge on loans given to the Meos. Much Meo land has already passed into bania hands as a result of the inability to repay loans. Educationally, too, the Meo community is extremely backward; and estimated 10 per cent of the Meos are literate. To add to all their many woes, the Meos complain of government neglect and discrimination against them on religious grounds by local officials.

If the general conditions of the Meos is woeful, that of the Meonis, the Meo womenfolk, is even more distressing. In the sphere of household work, the burden is almost entirely on the women. Forced by acute poverty, right from childhood young Meo girls must assist their mothers in household chores and so cannot go to school. They tend to their younger siblings,

graze goats and sheep, and roam the bare, barren slopes of the Aravallis in search of firewood. Unlike in many other peasant communities, agricultural work too is largely a woman's domain among the Meos. In many cases the only agricultural operation done by the men is ploughing. Offering an explanation for this phenomenon, Usman Khan, former sarpanch of Jharpudi village in Gurgaon district says, "This is because our women are a very brave race ('bahut bahadur qaum hai'). So strong are they that when they deliver children they are back to work the next day cooking food for their families". Another informant, however, attributes the overwhelming dependence of Mewati agriculture on Meoni physical labour to the general economic and cultural backwardness of the community and to Meo insensitivity towards their women. "Meonis are doubly exploited", he says. "First, they, along with Meo men, suffer at the hands of the banias and the officials. Then, they are exploited by their men themselves. Some are even treated as dumb cattle though our religion strictly prohibits this."

The Meos are one of the few Muslim communities in India who, in matters of inheritance, are governed by their own customary law and not by Muslim Personal Law. While the latter provides for a share for daughters in the property of their deceased fathers, the former does not. Granting daughters inheritance rights in land, Meos contend, would further contribute to the rapidly increasing fragmentation of their already unviable landholdings, a problem that has become extremely acute with rapid population growth. Dowry is seen by the Meos as taking the place of women's inheritance rights, though it is not an Islamic custom allowed by the 'shariat' (Islamic law). However, the two are not equivalent; unlike the property which Muslim women inherit from their fathers, over which they exercise control, dowry is paid to the groom's family and the bride has no rights over it. The dowry problem is becoming

increasingly acute. Among the better-off sections of Meo society, men compete with one another to pay higher dowries for their daughters in order to enhance their social prestige. Despite several caste panchayats having been held by Meo 'chaudhries' (leaders), in which it was unanimously decided to do away with dowry, the practice shows no sign of abating. In fact, many of the chaudhries who had vociferously condemned dowry at these panchayats themselves paid grand dowries when it came to the marriage of their daughters.

Meo families are generally large and women begin producing children soon after marriage. Meos believe that family planning, especially limiting the number of children, is strictly prohibited in Islam. Most maulvis do not deal in their sermons with such concrete social problems as poverty, illiteracy, women's rights, and family planning. Instead, they generally confine themselves to lecturing about the importance of faith ('iman'), prayers ('namaz') and fasting ('roza'). If, says Mustaq, a Meoni from Nuh, they were to lecture to their congregations about what role religion could play in solving the growing social problems of the Meos, they would be more socially productive and relevant than at present. Mushtaq suggests that books on Islam and social problems should be abridged and translated into simple, readily understandable Hindi and Urdu and made available in the qasbas of Mewat at affordable prices so that the Meos can benefit from them.

If the literacy rate can be said to be a measure of development, the Meonis seem to have registered virtually no development at all. According to reliable estimates, not more than 1 per cent of all Meonis are functionally literate. In the entire community of over a million, there are said to be not more than 20-25 women graduates. In most schools of rural Mewat, there are hardly any girls at all. Meoni illiteracy does not stem simply from patriarchal prejudices that frown on women's education, since over 90 per cent of Meo men themselves are unable to read and write. Given the extreme poverty and educational backwardness of the community as a whole, the low priority given by the Meos to female education is hardly surprising.

However, many Meos today seem less disinclined to educating their girls. The Meos and their maulvis are beginning to accept that Islam does encourage all believers, women included, to acquire education. The general refrain now seems to be that they do not send their girls to school for various other reasons, and not because it is something inconceivable, something that their religion proscribes.

One argument is that they have retained many of the patriarchal customs and values of their putative rajput past which discourage female education. Another reason they give is that secular education is of no use to their girls because they are anyway not going to get government jobs (school is seen here largely as a means of acquiring employment in a government department). A third argument is that there is no 'char-divari' (seclusion of women within the four walls) and 'parda' (veil) there, and the girls would be seen and taught by 'ghayr' (strange) men. It is also said that girls who study in the government schools are teased by the boys.

Meos contend that they would be enthusiastic about educating their daughters if there were 'zenana' (all-girls) schools with only women teachers. Interestingly, while the absence of zenana schools is seen by the Meos as the reason why they should not send their girls to school, they show no similar hesitation in making their women work in the fields, in open view of 'strange men'. Further, the 'burqa' is almost entirely unknown in Mewat,¹ and so also is strict seclusion, for Meonis must work outside their homes. Argues Mohammadi Begum, the Meoni librarian of the Mewat Model School, Ferozepur Jhirka, "If our working in the fields the whole day without burqas is acceptable to our menfolk, how is it that studying at school, learning proper manners and etiquette, dressed in 'hijab' (modest dress), can be said to be against religion?" Echoing the same sentiment, Fajruddin Khan, sarpanch of Doha (Gurgaon district) and founder of the Bibi Fatima Girls School, the first and only all-girls' Meo-run modern school, says, "Islam enjoins upon all believers, men and women, to acquire knowledge. Unfortunately, most Meos are in the dark about this. One of the main reasons why we Meos are getting poorer is that we do not have educated mothers. Mothers are actually the very madrasas of our children. Education will make our girls aware of what is 'halal' (right) and 'haram' (wrong), which is also what Islam wants them to learn. So how can it at all be said that schools will spoil them?" According to Salma Begum,² a post-graduate Meoni from Delhi's Jamia Millia Islamia, now teaching Geography at the Mewat Model School, the Meos would not have been as hostile to girls' education had it not been for a few cases of educated Meonis getting married on their own accord outside the Meo community, albeit to other Muslims. Because of this, she says, many Meos think that education will 'spoil' their girls, threaten the traditions of the community. Hence, she maintains, it is necessary for the few educated Meonis to be particularly careful about how they behave so as not

to jeopardise girls' education among the Meos forever. Patriarchal norms and customs, which are actually against the spirit of Islam, says Salma, can only be gradually countered.

It would be naive to see school education, as it presently is, as the panacea for Meoni backwardness. Barely 40 per cent of the teacher's posts in Mewat are filled. The teachers here, mostly banias and Punjabis and very few Meos, are notorious for taking little interest in the development of their students. Moreover, the curriculum, besides providing basic literacy and numeracy skills, seems hardly related to the concerns and conditions of the rural Mewati students. The highly sanskritised Hindi of the textbooks is beyond the comprehension of most. The books tend to reinforce traditional communal and gender stereotypes. Besides, a common complaint is that the textbooks tend to glorify brahminical Hinduism and the 'upper' castes and portray the Muslim rulers in a bad light, ignoring the great contributions of Islam. In the absence of a thorough revision of the curriculum, the lack of enthusiasm on the part of the Meos to send not just their girls but even their boys to school is understandable.

Increasingly, the Meos are sending their girls to Islamic 'maktabas' (primary schools) attached to most village mosques. There they learn to read Urdu and are taught to memorise parts of the Holy Quran. Few maktabas actually teach their students how to write. Though the pedagogical techniques employed, and much of the content of the education imparted at the maktabas leaves much to be desired, for the Meonis they are the only affordable and culturally acceptable means to acquire reading skills. Most maktabas are co-educational. No fixed fees are charged; parents give grain and money to the Maulvis to teach their children, though for poor families this is not compulsory. Girls are withdrawn from the maktabas as soon as they attain the age of puberty and are then married off, for from that age onwards they become vulnerable to ghayr men, including their male teachers. The maktabas of Mewat and their teachers are still completely untouched by modern, progressive Islamic theological developments. The 'dars-i-nizami', prepared way back during the reign of Aurangzeb, is still the 'nisab' (curriculum) for almost all the madrasas in Mewat, as for the rest of India. Almost no maktab or madrasa receives newspapers or journals and very few of them get even Islamic periodicals. Thus, leave alone the girl students, even their 'ustad' (teachers) are quite in the dark about the fast-changing world around them. The overwhelming stress at

the Islamic schools is on the inculcation of moral qualities; girls are also taught how to be 'good' wives and mothers.

Meonis who learn to read at the maktabas hardly get a chance to practise their reading skills after they pass out and get married. They simply do not get the time to read and their husbands generally cannot afford to buy literature for them. Thus, many simply forget how to read after a few years. Those who do get to read once in a while lack access to suitable reading material. Enquiries reveal that there are almost no subscribers even to Islamic women's magazines in the whole of Mewat. In the small qasbas there are hardly any bookshops, and the few that exist deal in textbooks. In the larger qasbas such as Tijara, Nuh and Ferozepur Jhirka, there are a couple of mobile bookstalls which deal in Islamic books and tracts. These are the only source of reading material for most Meos and Meonis, though the shop-owners reveal that most of their customers are maulvis and not ordinary peasants. There are just a few books available at these stalls that deal specifically with Muslim women. The most popular of these are *Bahishti Zevar* by Maulana Ashraf Ali Thanvi and *Musalman Bivi* by Maulana Mohammad Idrees Ansari. These texts merely reinforce traditional gender roles and stereotypes. Likewise, almost all the other religious tracts sold at these stalls are of the traditional sort. No progressive literature, whether Islamic or otherwise, is anywhere available in Mewat.

RECENT DEVELOPMENTS

Today there are signs that the Meos are waking up to the pressing urgency of educating their girls. Three girls' maktabas and schools have been set up in Mewat so far. Fatimiat-ut-Zohra school in the village of Sakras (Gurgaon district) is one of Mewat's very few all-girls' Islamic maktabas. Fajruddin Bashir, the village's young post-graduate sarpanch, and a local social activist, Nazir Ahmad, were the inspiration behind it. Established in June 1993, it already has nearly 70 students on its rolls. The two young lady teachers are daughters of Ahmad; they have just completed a five-year 'alim' course at the Jamiat-us-Salihat, an Islamic girls seminary at Malegaon, Maharashtra. The school's course consists of Urdu grammar and two texts dealing with religious matters. The textbooks are given free to the students, though notebooks and uniforms have to be purchased. Tuition fees are Rs 20 per month, but they are waived for those who cannot afford to pay. The maktab is presently run in a kacha room which is kept spotlessly clean. Despite some opposition from a faction

of the Meos of Sakras, who see the setting up of the maktab as a ploy to win votes, the sarpanch is making arrangements to house it in a more permanent building. He hopes to turn it into a girls' school where both secular and religious subjects will be taught. It is only by combining the two, he says, that the Meos will be able to appreciate the value of girls' education.

The Kulliyat-ut-Tahirat ('School for Pure Girls') is the girls' section of the sprawling Meel ka Madrasa at Meel Khedla in Bharatpur, Rajasthan. It was started in 1993. Its founder and principal is Maulvi Qasim, grandson of the well known Meo Miyanji Musa, who played a leading role in the spread of the 'Tablighi Jamaat', an Islamic reformist movement in Mewat. Today about 300 girls study here, mostly Meonis. The school has attempted to introduce some elementary mathematics, Hindi and Home Science in its curriculum, but Maulvi Rashid, the 'nazim-e-talimat' ('director of education') says that this has not been able to proceed very far due to their inability to pay the high salaries demanded by trained teachers of these subjects. They have to rely on madrasa products instead to teach secular subjects for which they have not received any training. Girls are admitted to the school at the age of seven and are allowed to study until age 12, for they then approach puberty and are nearly all married off. They stay together in one wing of the madrasa along with the all-female teaching staff. Maulvi Rashid says this is the only girls' boarding school in the whole of Mewat, for few other maulvis are willing to take the great risks entailed in such a venture. Perhaps the most impressive and remarkable of the girls' education projects in Mewat is the Bibi Fatima school at Duha (Gurgaon), close to the Alwar (Rajasthan) border. It is a private school of the sarpanch Fajruddin Khan, who is so popular that he has been returned to the post unopposed since 1983. Khan is barely literate himself, yet his enthusiasm for education, especially for females, is boundless. He says that since 1983 he has been spending 60 per cent of the panchayat's entire budget on education alone. As a result of his untiring efforts, Duha now has a government high school, a government girls' school and his own Bibi Fatima primary and middle school, which started functioning in 1992. This school has over 170 girls on its rolls, most of them Meonis but many also from local non-Muslim castes as well. Its all-woman staff, too, is mixed in term of religious and caste affiliation. The Haryana Board syllabus, despite all its limitations and cultural inappropriateness for rural children, is followed by the school.

Religious education is imparted by a Meoni teacher to the Meo girls two hours every day after class hours. The idea of setting up the school, says Fajruddin Khan, came to his mind when he saw the cruel exploitation of Meoni labourers in the stone quarries that businessmen from outside have now begun operating in Mewat. He realised that the only way they could fight against this oppression was by becoming educated about their rights.

Khan has a word of advice and caution for social reformers in a hurry – changing fossilised beliefs, customs, values and institutions is a long affair, a gradual process. Policies and programmes that ignore local cultural sensibilities are, more often than not, doomed to failure from the outset.

Conserving Biodiversity Need for Statutory Support

A K Jha

While there are many laws which allow for the conservation of biodiversity in India, many of the provisions cannot be implemented because of existing socio-economic and political constraints.

BIODIVERSITY is the sum total of all life forms. This is perhaps the simplest expression for the most complicated system on earth. For attempting to comprehend biodiversity in its totality and understand its various aspects scientists have used the concepts of ecosystem diversity, species diversity and genetic diversity. For a manager, however, the individual as well as combined 'status' of these diversities are the things that matter.

Conscious manipulation as also wanton destruction of habitat as pronounced behavioural aspects are relatable to hardly any species other than *homo sapiens*. As a consequence the observed decline in biodiversity is simply mind-boggling. Scientists believe that the total number of species in the world is somewhere between 10 and 80 million out of which about 1.4 million species have been identified. Reports however indicate that about 100 species of invertebrates are lost to deforestation and habitat destruction each day. All species of mammals as well as carnivorous on earth are declining. More than two-thirds of the world's 150 species of primates (which include monkeys, lemurs and humans) are threatened with extinction. Three-fourths of the world's bird species are declining in population. A worldwide decline is observed in

Notes

[Material for this paper was collected during three field trips to Mewat in November 1992 and January and March 1993. I am particularly grateful to Salmaji, Mohammad Swaleh Khan Saheb, Bani Aroraji, Maulvi Rashid Saheb and numerous Meos too many to be mentioned, for the information that they freely shared with me.]

1 Over the past few years a few Meonis, generally in the towns, have begun donning the burqa. They belong to families that have improved their economic situation such that they can dispense with their women's agricultural work.

2 Salma plans to do her PhD on the women of Mewat. She had earlier wanted to work on modern education among the Meonis but she changed her mind on realising that the universe of her study would have been microscopic, not more than 0.001 per cent of the Meoni population.

amphibians in recent years and most of the fishes have declined in population ('Conserving Biological Diversity' by John C Ryan, *State of the World* 1992, World Watch Institute). In short, mass extinctions seem inevitable and with the present level of inertia and myopic approach towards tackling all including environmental problems in most of the countries, death of mankind will, in all probabilities, be a case of suicide.

In India the situation is no less alarming in any way. About 45,000 species of flora and 65,000 species of fauna are found in India, population of most of which is declining.¹ Over 1,500 species of flora and fauna are in the endangered category. As on today out of the total area of 329 million ha, 175 million ha of land in India is in a degraded condition because of erosion, salinity, alkalinity and various other factors indicating loss of biodiversity. Similarly grasslands and pastures, just about 3.5 per cent of our geographic area, are under severe degradation due to the pressure on account of a 500 million domestic animal population. The 75 million ha area of forest land in India has about 40 per cent area under-stocked and under visible stress resulting in loss of biodiversity for one reason or the other. Wetlands and marine ecosystems rich in aquatic and bird-life are also facing

problems of over-exploitation and pollution leading to loss of biodiversity. All these warrant a specifically oriented immediate action plan for biodiversity conservation supported by an effective legal framework not only suited to the present socio-political-economic situation prevalent in India but also duly aligned with the long-term strategies of development. The task obviously is not easy.

The IUCN (the World Conservation Union), UNEP and WWF indicate that countries should have comprehensive systems of environmental law to safeguard human rights as well as interest of future generation. The productivity and diversity of the earth should also be protected by this mechanism through recognition of the legitimacy of 'local approaches'.

At present the concern of the government of India for biodiversity conservation is expressed through various acts and legal documents which constitute environmental laws in India. Important amongst them are The Indian Forest Act, 1927; Wildlife (Protection) Act, 1972 (amended in 1991); Environmental (Protection) Act, 1986; Forest (Conservation) Act, 1980 (amended in 1988); The Water (Prevention and Control of Pollution) Act 1974 (amended in 1988); The Air (Prevention and Control of Pollution) Act, 1981 (amended in 1988) and the Notification on Coastal Regulation Zone, 1991. The National Forest Policy 1988, and National Conservation Strategy and Policy Statement on Environment and Development, 1992 published by government of India also indicate furtherance of the cause of conservation. Interestingly, most of the efforts to ensure compatibility of conservation-oriented legal structures with the changed socio-economic conditions have taken shape from 1986 onwards. Apart from these, various judgments passed in cases related to issues pertaining to conservation of forest and wildlife in particular and to the effects of pollution, etc., on the natural resources as well as human life in general indicate that the thinking of judiciary is also becoming predominantly pro-environment. This has specific implications for the conservation movement in our country and adds to its strength by buttressing the statutory support to the same.

The Indian Forest Act, 1927 (IFA) contains one of the first land settlement strategies in India. It, however, also prescribes specific acts allowed/prohibited in various categories of such land as well as in regard to biodiversity elements in the name of 'forest produce' depending on the statutory status granted to the same by the act. Considering the definition of 'forest produce' one finds that it is of two specific categories as detailed in the Section 2(4) of the IFA. The first category includes specifically mentioned items in Section 2(4)(a) like timber, char-

coal, catechu, mahua flowers, etc., which whether found in or brought from forest or not, are included in the definition of 'forest produce'. Thus, this category of specifically indicated material gets subjected to all rules and regulations under IFA irrespective of its place of origin. The other category indicated in 2(4)(b) derives its status as 'forest produce' from the place of its origin, i.e., it is a 'forest produce' only when it is found in forest or is proved to have been brought from a forest. This category includes general items like parts or portion of plants and trees, wild animals including their parts or produce, etc.

In the case of reserved forest (RF) the land as well as 'forest produce' on the same automatically receive, by virtue of reservation notification itself, protection against human acts made punishable under the act as per specific provisions. Under this act the rights of the local people in case of RF are either allowed to continue by altering the proposed boundary or translocated onto a convenient patch or are commuted by the forest settlement officer (FSO) as per laid down procedure. The FSO concerns himself specifically, apart from other rights, with the right to receive or take 'forest produce' from the forest area and also whether such material can be sold or bartered by the right holder. In protected forest (PF), however, the nature and extent of the rights are simply enquired into and recorded. In case it is essential to declare an area protected, the state government does have the authority to declare the area as such but the existing rights of individuals or communities are not to be effected or abridged. In PF the state government is required to declare certain species as reserved or make rules to specifically cover 'forest produce' for bringing the same under the purview of the IFA. It can suspend the rights of private persons in some specific portion of PF provided the remainder of such forest is sufficient for a convenient exercise of the rights so suspended. Thus, regulating collection, subsection to manufacturing process, or removal, etc., of any forest produce from PF requires specific notifications to be issued by the state government. Without this the biodiversity in PF cannot be effectively managed by using IFA. The state government can notify any land just as 'forest' also and prescribe regulations for the conservation of trees and forest thereon under the IFA. In some states, however, governments have enacted Private (Forest Acquisition) Acts to serve the purpose. The action in this regard is basically intended to be taken in the interest of some public purpose like preservation of public health, maintenance of water supply, conservation of trees and forests, preservation and improvement of soil condition, etc. The IFA also provides an opportunity to the owner of any land to

request the government to get his land managed as reserved or protected forest through government agency.

Biodiversity is found not only in the legally declared 'forests' but outside also and 'forest produce' can be seen as the building blocks of the same. As on today, however, majority of the species and items that constitute biodiversity fall in the second category, i.e., in Section 2(4)(b) and they can be confidently subjected to regulations of IFA within the notified forest areas only. No sooner that such material comes out of the forest area through one means or another the task of regulating its movements, etc., by using provisions of IFA becomes difficult and benefit of doubt, more often than not, goes in favour of the people dealing in such material. Notwithstanding the fact that the forest department has concentrated generally on the management and exploitation of major 'forest produce' like timber and other items contained in the first category, the control on the exploitation and exit of plant parts and portions like medicinal herbs and shrubs becomes difficult because most of these are collected as a consequence of exercise of rights/concessions by the tribal and local people and the aspect of 'sale' or 'barter' is neither clearly mentioned in the FSO's report nor it is practicable to be effectively monitored by the department. There are very few forest divisions where items of 'forest produce' of Section 2(4)(b) are either managed through a proper inventory or auctioned. Thus, because of lack of organised collection and removal at the field level there is hardly any control on these elements of biodiversity and most of the material reaches market through middle-men who purchase the same from the local and tribal people and reach the same to the wholesalers for further export or use within India depending on its potential use. At the point of export, in most cases the wholesale dealers as well as retailers tend to indicate that the material with them has changed number of hands and also that the non-wood forest produce existing with them is either cultivated or originated from a non-forest area. For want of infrastructure as well as due to non-availability of verifiable linkages and parameters utility of any effort intended to determine backward linkages becomes an obvious conclusion and there is always a possibility of export of such items without detailed verification about legality of their procurement under the pressure of 'liberalisation' in the Exim policy. The fact, however, remains that because of the unorganised nature of trade at the initial stages the worst sufferers are both tribals as well as the resource-base. As a matter of fact the local and tribal people do not restrict themselves to the areas assigned by the FSO for the purpose resulting in lower earnings as well as indiscriminate

removals and degradation. The forest guard, more often than not, is either a party to the whole exercise or is a silent observer since he is not oriented to take cognisance of such 'petty items' going out through the exercise of a 'right' or 'concession'. The major chunk of the profit is taken by the middle-men who exploit the local 'collectors'. Thus despite the fact that the IFA seems to be having provision as well as potentiality for regulating the exploitation as well as transit, etc., of all 'forest produce' originating from forests, at the time of actual implementation, the results are extremely difficult to achieve. The non-specific nature of definition of non-wood forest produce as 'Forest Produce' in the Section 2(4)(b) of the act is also partly responsible for this ineffectiveness. Even for the items of Section 2(4)(a) that are very limited in number, the practicability of enforcement in areas outside forests except for 'visible' items like timber, charcoal, etc., is also quite often jinxed for one reason or the other.

WILDLIFE ACT

Considering the potentiality of Wildlife (Protection) Act 1972 (WLPA), one finds that the sanctuaries and national parks (protected areas) duly declared under this act are subjected to specific provisions in regard to the notified area of PAs in general and 'wildlife' as the target item in particular whereas the provisions regarding regulation of transit, trade and commerce in areas outside PAs are limited to specific items like 'wild animals', 'animal articles', 'trophies', 'specified plants', etc., as defined in the act. 'Wildlife' has an extremely wide connotation and an inclusive definition contains vertebrates, invertebrates as well as vegetation forming part of any habitat. Thus inside PAs all the building blocks of biodiversity get statutory cover by virtue of application of WLPA provisions to 'wildlife' as such. Outside PAs, only six species contained in the schedule VI of the WLPA attract the various provisions of the act so far as 'Flora' is concerned. The faunal category also restricts itself to the 'wild animals' specified in schedules I to V in non-PAs unless the first part of the definition of 'wild animal' indicating any 'animal' found wild in nature is emphasised strictly and effectively during implementation. The chance of acceptance of such interpretation having extremely wide scope as also the possibility and feasibility of discovering definitive backward linkages at implementation levels for pinpointing origin of any animal seem quite remote in the present circumstances. Again, the practicability of total reliance on Section 57 prescribing bureau of proving legality of possession as lying on the

accused, quite often, is liable to be questioned especially as a contrast element *vis-a-vis* other criminal acts. These obvious limitations reduce the scope and effectiveness of the provisions of WLPA by reducing the number of target elements of biodiversity to specific items specified in the schedules of the act. A further reduction in the number is caused by the definition of 'animal' which excludes invertebrates and hence all entries of invertebrates in the schedules of WLPA can, by this interpretation, be seen as redundant or outside the purview of the act. Such definitions tend to reduce the definitiveness of applicability of the act and also confidence-level of implementors by increasing the scope of interpretation that could be used against them. The various schedules of WLPA contain approximately 155 species of mammalia, 2,100 species of aves, 320 species of reptilia, 3,100 species of arthropoda, six species of amphibians and six species of plants. Thus, outside PAs only these number tend to confidently attract the provisions of WLPA while the total number of flora and fauna making up our biodiversity wealth is approximately 0.11 million. In short WLPA has limited applicability both in terms of area as well as target species so far as conservation of biodiversity is concerned.

The Forest (Conservation) Act, 1980 (FCA) was brought in to primarily regulate the diversion of forest areas for 'non-forestry' purposes. The FCA defines 'forest area' as any area shown as 'forest' in government records and accordingly its provisions are applicable not only to government-owned forests but also to private forest areas. The Goa bench of Bombay High Court in a recent judgment has further enhanced the scope of FCA by indicating that even such areas which may not be shown as 'forest' in government records but have vegetative cover to make it look like a forest attract the provisions of the act (Shivanand V Salgaonkar vs DCF, Goa State, Writ Petition 162 of 1987.)

The FCA has often been criticised as being anti-developmental but the fact remains that it has effectively helped in checking the mass scale diversions of forest areas that went on prior to 1980 and accordingly has significantly reduced the pace of loss of biodiversity on this count in our country. Notwithstanding the fact that compensatory afforestation in no way can adequately compensate the loss of biodiversity on account of change of land use, it can definitely be seen as creating possibilities of development of biodiversity in such newly afforested areas. The regulations regarding monoculture, though seemingly stringent against in situ conservation of certain desired species of medicinal plants, have their positive aspects

also in regard to the conservation of overall biological diversity in forest land *per se*.

PROTECTING ENVIRONMENT

The Environmental (Protection) Act, 1986 (EPA) came up as a general legislation with a resolve to protect and enhance environmental quality. It intends to regulate the discharge of environmental pollutants and handling of hazardous substances. An important aspect of EPA is the grant, similar to that in the WLPA, of power to private individuals to proceed against offenders directly in the court of law after giving a notice to the specified authority for the purpose. The EPA can be seen as an important tool for preventing depletion of biodiversity in the non-forest lands through control mechanisms safeguarding environmental concern. The Water (Prevention and Control of Pollution) Act, 1974 (WPCA) and Air (Prevention and Control of Pollution) Act, 1981 (APCA) have also been used to create conditions conducive to the conservation of ecosystems and biodiversity therein, though simply as logical and legal consequences. Various courts in India have considered and decided upon broader environmental issues utilising the above acts in favour of conservation. In *MC Mehta vs UOI* (1987) 4 SCC 463 the Supreme Court has indicated that life, public health and ecology have priority over unemployment and loss of revenue. The Kerala High Court in 9711 of 1989 recognised the ill-effects of actions imperilling riparian habitat as well as flora and fauna and gave judgment in favour of conservation of the same. The question of pollution and environmental degradation have been considered by various courts in India on the fundamental premise that the right to environment is part of right to life and the right to life is more than immunity from extinction.

The Kerala High Court in 3473 and 4622 of 1988 has noted that when degree of pollution crosses tolerance limit it invades the rights under Article 21 of the Constitution. The judgments passed under the above acts have a vital impact not only on the lives of human beings but also on the biodiversity in and around polluting agencies on a long-term basis as a definite corollary. In the judgment of Calcutta High Court in 2851 of 1992 (*People United for Better Living in Calcutta Public vs State of West Bengal and Others*) the question of wetland conservation has been dealt with in detail wherein the high court has restrained the respondents from reclaiming wetlands for changing its land-use and has directed to maintain the nature and character of the wetlands in the present form as well as stop all encroachments. This judgment not only reiterates India's commitment to the Ramsar convention on wetlands signed by our

country in October 1991 but also broadly reveals the priority granted by the court to the issue of biodiversity conservation in such areas. The national programme of the ministry of environment and forests on wetlands, mangroves and coral reefs ensures full financial assistance to the state governments for conservation of such areas but relies basically on EPA, FCA, WLPA, WPCA and APCA for creating the necessary statutory back up.

Environmental degradation and biodiversity depletion are special types of social problems. Any society can be eco-logically sustainable only if it conserves biodiversity while simultaneously protecting the life support system. This requires, as simultaneous endeavours, prevention of erosion of eco-frontiers and building up of a viable system bio-reserves. The development of PAs network is first step in this regard. Presently PAs of India cover about 1.3 lakh sq km which is about 4 per cent of the geographic area. The recommendations of the PA Network Report² envisage a total area of 1.8 lakh sq km or 5.6 per cent of the geographic area. Even if this target is fulfilled, the major thrust area for biodiversity conservation has to be non PAs.

The National Forest Policy 1988 announced its basic objective of the policy duly highlighted by the expression that the above domestic requirements of the tribal and other poor living in or near forests should be the first charge on forest produce. Considering the present socio-economic condition and also condition of the resource-base in most of the non-PAs a regulatory effort with reference to biosphere people coupled with incentive-based system of regeneration of the non PAs through ecosystem people's participation is perhaps the only option available for any significant impetus to conservation efforts and such an approach can be sustained only if there exists an appropriate statutory support to the same. With the process of impoverisation tending to establish the ecosystems people as agents of the biosphere people in the overall degradation matrix the local people act against their own interest and suffer gross malnutrition indicated through body weight and mid-upper arm circumference.¹

The writ petition in the Bombay High Court, Nagpur Bench by Sheela Barse in 1993 on the issue of deaths of tribal children in areas of Melghat close to townships clearly indicates that the deaths could be related to the degradation of land and consequent non-availability of edible forest produce as well as crude drugs that were constituents of the system of medicine practised by the Korku tribes. The revival of interdependence of indigenous people and biodiversity elements has no substitute in the present circumstances but now this needs a new approach with statutory sup-

port. In the present democratic situation not much of positive response in favour of conservation can be ensured by activating certain penal provisions, like the Section 79 of the IFA which prescribes action for failure to assist forest officers in their efforts to protect and preserve forests that are reservoirs of biodiversity. Field experience and related records show that this section as also Section 81 of IFA have virtually remained non-implementable in the present socio-political scenario.

International trade is yet another aspect influencing biodiversity conservation issues in a substantial manner. The Convention of International Trade in Endangered Species of Wild Flora and Fauna (CITES) and Export-Import (EXIM) Policy are operated by India to regulate its international trade in regard to biodiversity items like plants and wild animals and parts and products thereof. As signatory to the Convention on Biodiversity held in Rio in 1992, India is committed to the fulfilment of its various objectives with a determination to conserve and sustainably use biodiversity for the benefit of the present as well as future generations. In this regard the issue of coupling the access to appropriate technologies with sharing of genetic resources is of utmost importance since many species unknown to the modern world are in use by indigenous people in their traditional lifestyles and their sustainability could be jeopardised if they get opened to world trade without development of complete knowledge about them. As of today a number of plant portions obtained from various countries come into India for making their extracts/derivatives and further re-export because labour in India is cheaper. Further, a number of bio-fertilisers and bio-control agents are being developed and exported from India. All these tend to go on without much of control in the name of liberalisation quite often ignoring the aspects of intellectual property rights and biosafety aspects. With globalisation of trade in bio-resources, the need to protect the rights of farmers and plant breeders has also become extremely important. Thus Exim Policy, which for the first time in 1994-95 has incorporated the principles of ecological considerations in its objectives, needs to be further attuned to biodiversity conservation issues. Simultaneously it is essential to formalise and monitor internal trade also with a view to know and relate its quantum to specific 'status' of species in commerce in the interest of conservation.

Any new legislation giving effect to biodiversity conservation has to be enacted in consonance with the existing legal instruments while not only considering the present socio-economic condition and development but also anticipating the changes on a long-term time-frame. While

accepting as well as rewarding the socio-cultural ethnic knowledge of the indigenous people, provisions safeguarding the long-existing interdependence of such people and resource base need to be incorporated as one of the basic themes in such an instrument. This will also require a mechanism with statutory back up to control the trade in biodiversity elements in a way so as to protect the resource as well as bona fide producers and users from being exploited. A sharper focus on the lower group of plants and animals irrespective of their place of origin has to be built up through such a legislation and, as a concomitant action, the definitions in WLPA and IFA should be modified to include imported biodiversity elements and also genetically transformed material. The statutory bindings on genuine in situ conservation efforts with the help of local people should encourage primary producers and interventions by government should be limited to the extent of saving them from exploitative forces. The ex-situ conservation and genetic transformation efforts, however, should also be a matter of scrutiny from the points of view of access to genetic resources in the wild, compatibility and comparability of the created resource, transfer of technology, intellectual property rights, and bio-safety considerations. The concept of sustainability will have to be introduced into the planning and developmental efforts concerning biodiversity while building up simultaneously a system of adequate compensation for the ecosystems people in cases of loss of biodiversity due to unavoidable reasons. (See 'A System of Positive Incentives to Conserve Biodiversity' by Madhav Gadgil and P R Seshagiri Rao, *EPW*, August 6, 1994). Grant of incentives for conservation efforts should also find a place in this instrument. As a specific piece of legislation it should also bridge the gaps between the various components of the existing system of environmental laws as specified in the earlier paras. Considering all the above requirements and also the limitations of the existing acts in the changed circumstances it is necessary that an effective statutory back up through a new act is provided to the biodiversity conservation strategies that are attempting to shape the future of India.

Southern Africa in New International Order

V S Sheth

The relations between southern African states in the post-apartheid era will evolve at the dictates of the emerging world order, and that the fulcrum of this evolution will continue to rest with Pretoria.

HUNDRED years after Gandhiji set his foot over South African soil, racial discrimination and apartheid have been finally eliminated with the installation of a non-racial government in South Africa. The termination of the apartheid system in South Africa and the end of international cold war will decisively change the political dialogue in the African continent. The first part of this essay traces the growth of interdependence and democratisation in the international community as well as in southern Africa. The second part discusses the relations between southern African states in the emerging international order. My essay argues that the relations between southern African states in the post-apartheid era will evolve at the dictates of the emerging world order, and that the fulcrum of this evolution will continue to rest with Pretoria.

INTERDEPENDENCE, DEMOCRATISATION AND SOUTHERN AFRICA

The world order had a dialectic evolution under the growing influence of science and technology on the human life. Expansion of science and technology have generated forces of democratisation and interdependence within the international community, which have dealt a mortal blow to the supremacy of the colonial, imperial and racist forces in latter half of the 20th century.

The southern African region, including South Africa, constitutes a single geo-eco system, which was partitioned by the European powers during the 19th century. The arrival of colonisers in the 19th century saw the birth of the policy of political and economic discrimination on the basis of physical features and the skin colour. The policy of racial discrimination, and subsequently that of apartheid, drew inspiration from the principle of white man's supremacy. The theories of colonialism and racism shared a common belief that the institutions and values of the white man were superior to whatever the African possessed and it was duty of the former to uplift the latter to a higher standard of civilisation. The linkages between colonialism, imperialism and racialism were not incidental [Sheth 1991:32-41]. Though the white-dominated South Africa became independent in 1910 and expanded its territorial hold to south-west Africa at the end of first world war, the European colonial control in southern Africa gave the South African whites moral support in their

policies during post-second world war period.

The policy of apartheid in South Africa evolved from 1910 to 1960, a period during which the imperial and colonial forces survived two disastrous wars and faced increasing ideological and nationalist opposition all over the world. The attempts to operationalise the colonial relationship of dominance and dependence through the League of Nations failed, and gave way at the end of second world war to nationalist and democratic forces. The difference in the territorial spread of two world wars fought within the time-span of one generation revealed the speed with which science and technology had made different parts of the world interdependent in the time of war. The shift in the power centre under bipolar conditions and the granting of independence to large number of colonies during the 50s and the 60s indicate the decline in the strength and status of former colonial and imperial powers in the face of growing interdependence and democratisation of nation-states relations.

INTERDEPENDENCE OF SOUTHERN AFRICAN STATES

In the post-second world war period, South Africa was strategically important for the survival of western influence over the region, and therefore, Pretoria was made the hub of regional balance of power. Simonstown agreement linked the regional balance of power to the global balance of power by aligning South Africa with western alliance system. During the cold war, political, economic and social advancement of the black majority was considered detrimental to the interest of the ruling white minority. The white masters of South Africa gave up free enterprise thesis of the classical school of the 19th century had developed a situation akin to the internal colonial exploitation based on the principle of complete segregation of majority blacks and minority white population in all aspects of life. Such a social system artificially designed to promote interests of a minority group of population depended upon ruthless use of state force and the support it managed to get from the outside powers. The white minority-controlled South African state, with the large black population lying within and outside its borders supplying labour to the white-dominated industry and mines. This was neo-colonialism wherein the exploitative

centre instead of lying outside in the metropolitan state, lay in the case of South Africa within the state having external economic and political linkages with the former colonial powers [Ramchandani 1986].

The dependence of the landlocked southern African states, namely, Botswana, Lesotho, Swaziland, Zimbabwe, Zambia on South African economy grew with the passage of time. South African economy, having well-developed infrastructure of transport, telecommunication networks, natural ports, advanced agricultural, mining, manufacturing and industrial sectors, large foreign investment and capital accumulation, and abundant supply of labour exerted a magnetic pull on the neighbouring landlocked economies [Clark 1977]. The dependence of the neighbouring states on South Africa expresses itself in more than one way. The World Bank estimate of mid-80s put the total number of migrants in South Africa at around one million, out of which only one-third have been legally employed workers in mining and agricultural sectors of the economy. Of these legally employed workers, four frontline landlocked states, namely, Botswana, Lesotho, Swaziland and Zimbabwe (BLSZ) provided 1,70,000 labour force while the remaining came from Malawi and Mozambique [World Bank Annual Report 1987]. Migrant labour working in South Africa remit a part or whole of their salaries to their families across the border and this has constituted significant source of revenue for some of these states.

The economic and population growth of the frontline states in the mid-80s compared unfavourably with that of South Africa. Poor economic growth rate resulted in unfavourable balance of trade and increasing external borrowings from these countries. In mid-80s Botswana, Lesotho, Swaziland, Zimbabwe and Zambia (BLSZZ) had 78, 97, 90, 18 and 14 per cent of their respective total import from South Africa as compared to 7, 42, 37, 10 and 6 per cent of their respective total export to South Africa [World Development Report 1987]. Landlocked situation has put severe constraints on BLSZZ states to have economic growth without any dependence on South Africa. Better infrastructural facilities and heavy discount offered by the South African transport system together with the insecurity and inefficiency experienced by the goods traffic in transit at the African ports have had the effect of increasing the dependence of landlocked frontline states on the South African ports of Durban, East London and Cape Town in the post-independence period [Sheth 1988:1-12].

INTERNATIONAL COMMUNITY AND NEO- COLONIALISM IN SOUTHERN AFRICA

The South African customs union (SACU), which has South Africa and BLS states as its members, enabled South Africa to operate as a *de facto* imperial power at the regional level. The imports by the member states from outside the union were subjected to

high external tariff by SACU, thus protecting the South African industries from outside competitors [Sheth 1988:1-12]. Realising the critical dependence of neighbouring African states, Pretoria in 1974 floated a plan of 'constellation of Southern African States', which if successful, would have increased South Africa's economic dominance in the region in terms of transportation, port and telecommunication infrastructure.

Contradictions within the colonial and imperial world, and its subsequent weakening, have resulted in democratisation of the international system. The new actors in the international system have taken advantage of the conflicting interests of the superpowers to create enough elbow room for their survival. United Nations at the international level and Organisation of African Unity (OAU) at the regional level provided expression to the democratic aspirations of the international community.

The sub-imperial South African economic and political systems sustaining on the neo-colonial linkages was at odds with the emerging democratic interdependent international system. Pretoria had disdainfully ignored the UN appeals in the 40s and the 50s to end its policy of racial discrimination. However, when the forces of nationalism gained success on the periphery of southern Africa with the independence of Tanganyika and Northern Rhodesia in 1960 and 1964 respectively, the whites in southern Rhodesia (Zimbabwe) were the first to revolt against their British colonial masters and had Unilateral Declaration of Independence (UDI). The whites in Rhodesia from 1965 to 1980 shared the values and policies of Pretoria and provided it with valuable safety belt to thwart penetration of continental and international influences prejudicial to white man's supremacy. Similarly, when the Portuguese transferred power in mid-70s in Angola and Mozambique the threat of black nationalists to the minority-ruled South African state increased. Pretoria attempted to destabilise the political regimes of these newly independent states.

The increase in pressure from the international community on apartheid during the 60s, the 70s and the 80s was in direct proportion to the growing assertiveness of the nationalist and democratic forces all over the world. Pan-Africa movement in the late 50s and the OAU in the mid-60s called for the severance of diplomatic relations and adoption of economic sanctions against forces of apartheid. The fight against forces of colonialism and racialism was institutionalised in the 60s with the setting up of OAU Liberation Committee (1963), UN special committee against apartheid (1962), UN trust fund to help victims of apartheid (1965), and special unit on apartheid in UN secretariat (1966). Lusaka manifesto on southern Africa (1969) by 13 central and southern African states and 'International Conference on sanctions against South Africa' (1981) by UN-OAU combine were watersheds in the

fight to dismantle colonial and racist set-up in southern Africa. The whites rejected the demand for establishment of non-racial society through the exercise of the right to self-determination raised by these conferences, and this led to their isolation from the mainstream international community.

The public opinion in the developed countries changed rapidly under constant pressures emanating from third world countries. Revolution in communications and transport enabled man, material and information to move more swiftly around the globe. The information revolution made possible by satellite communication enabled people across the continents to behold the brutal face of apartheid and the insidious connection it had with the western democracies.

In order to counter mounting external pressures, Pretoria adapted different strategies. It unleashed state terror wherein millions of blacks were uprooted from their homes, imprisoned, killed, tortured and deprived of their citizenship. Democratic rights of expression, movement, residence and association were snatched away. African Nationalist Congress, too, suffered. Its activists either went underground or operated from across the national borders.

Pretoria's politico-military strategy of establishing 'Constellation of Southern African States' and its adoption of 'total strategy' to counter increasing pressures was accompanied by attempts to integrate South African economy with the western capitalist economies. It adopted a policy of rapid industrialisation which attracted large overseas investment in South Africa. International financial investment from the US, Britain, West Germany, IMF and World Bank had propelled the growth of South African mining, manufacturing sectors of economy in the 50s and the 60s. Foreign investors were attracted to South Africa because of the availability of cheap labour, expanding markets and hard convertible currency. Overseas investment supplied developmental capital and latest technologies, besides development of management skills. The policy of industrialisation enabled Pretoria to produce 80 per cent of industrial plants indigenously in the 70s and the 80s [Biswas nd:72-76].

COLLAPSE OF NEO-COLONIALISM

The growing domestic inequity in economically developing South Africa was unacceptable to the African nationalists and their opposition, with the support of international community, grew in direct proportion to the integration of South African economy with the world capitalist economies.

South Africa in the 80s was a beleaguered state as Pretoria was unable to insulate domestic events from external influences. ANC raised the banner of revolt and the cost of sustaining apartheid grew in direct proportion to Pretoria's ability to generate economic wealth for whites only. As a result of growing domestic violence and adverse

world public opinion, the flow of foreign investment declined in the 80s and the fear of economic and military sanctions forced the white minority government to import larger quantities of oil and modern armaments for building sufficient reserves to meet unforeseen circumstances. While South African exports were falling, the imports increased alarmingly, resulting in trade imbalance. The government urgently needed to promote domestic consumption of the goods for uplifting economy from recession and resource crunch. The reports of government commissions appointed in the 80s to investigate the problems of controlling black labour suggested certain policy changes for improving economic conditions of the labour [Sheth 1992:50-51; Singh nd:127-49]. Pretoria needed to liberalise the political system by restoring basic rights of the people and allow the labour to have better wages and greater say in the production of goods. At the same time, international community's resolve to make Pretoria see the light of the day and change its policies could be seen from setting up of 'Africa Fund' by NAM and the report of the group of eminent persons appointed by Commonwealth Heads of States and Government (CHOGAM). The white minority government, recognising the need for change in the 90s, released ANC leaders, lifted emergency and press censorship, unbanned ANC and started political dialogue.

CHANGING INTERNATIONAL ORDER AND SOUTHERN AFRICA

In contemporary world, interdependence has been globalised and has dissolved ideological aspects of hegemonic rivalries at the regional and international levels. The collapse of Soviet Union and eastern Europe and the end of cold war had a fundamental impact on southern Africa insofar as it has ended regional conflicts in South-West Africa (Namibia) and Angola and brought the apartheid rule in South Africa to a peaceful end. It has made the international relations appear unipolar with only one superpower remaining on the international scene. Unipolarity in the military field has led to the acceptance of free market and democratic processes for achieving welfare of the people. However, the dominance of the US-led western alliance has been conditioned by the emergence of new northern concert of powers (NNCP) consisting of EEC, US and Japan [Rana 1994: 121-23; Harshe 1994:137-39].

The third world countries in the bipolar conditions buttressed their capabilities by establishing regional organisations and adopted non-alignment as their foreign policy. While the non-aligned foreign policy has lost some of its old capabilities under the changing systemic pressures, regional integration processes, best exemplified by EEC, have retained their relevance as means to meet the growing demands of globalism.

Southern African states in 1979 established a regional organisation Southern African Development Co-ordination Conference

(SADCC) "to alleviate dysfunctional traditional operations of the sovereign state system on the ordering of relations" in southern Africa [Rana 1990:6]. SADCC has achieved modest success under adverse circumstances in reducing southern African states' dependence on South Africa and helped them to withstand Pretoria's policies of destabilisation and economic blackmail [Gupta 1990: 134-37]. Restoration of peace and democracy in South Africa will benefit the neighbouring states insofar as the resources utilised in meeting the damage caused by Pretoria would now be diverted to the more gainful purposes. Eminent Persons Group (EPG), appointed by CHOGAM commented in its report that Pretoria's policies of destabilising neighbouring states had cost SADCC 10 billion from 1981-82 to 1985-86 and that this amount was higher than the total foreign assistance received by SADCC [Ramchandani 1986:19-21]. Indeed, with Pretoria no longer interested in destabilising its neighbours, SADCC will now be able to devote greater resources to its ongoing development projects in the region.

Southern African region abounds in agricultural, forest, mineral and water resources, which if tapped properly has the potentiality of transforming the region into one of the powerful regional groupings in the world. All important minerals such as gold, diamond, iron-ore, coal, copper, plutonium, silver, uranium, manganese, zinc, tin, lead, bauxite, limestone, petroleum and natural gas are found in the region. Large segments of local population are engaged in the subsistence agricultural activities and grow cash crops such as coffee, cotton, sugarcane, coconuts, cashewnuts and banana. The struggle against apartheid and colonialism have kept the states neighbouring South Africa steeped in poverty in spite of having rich agricultural and mineral resources. On the other hand, the whites in South Africa have utilised economic resources to achieve prosperity for themselves, as it is revealed by the figures of investment and savings. The gross domestic investment in South African economy during 1987 was to the tune of 32,124 million rands constituting 19.5 per cent of GDP at the market prices while the domestic savings of the white South Africans in 1987 was to the tune of 32,276 million rands which was 23.3 per cent of the GDP.

During the last one-and-a-half decade of its existence SADCC has emphasised sectoral co-ordination and primacy of national decision-making in undertaking development projects. It has concentrated on improving transportation, communication and port facilities, undertaken research for improving crop production and food security programme. In spite of the opposition by South Africa to SADCC's development programmes, several international agencies, regional groupings and individual countries have given aid to SADCC. The conference had received aid from EEC, Nordic countries,

Arab Bank of Development, Kuwaiti fund, and individual countries such as India, erstwhile Soviet Union, West Germany, Italy, UK, Norway, Canada. SADCC's effort in mobilising local and international resource for implementation of its policies at national and inter-state level has been impressive in comparison to other African regional organisations [Ramchandani 1986].

The rate of investment and domestic savings in the 80s was not sufficient for maintaining the economic prosperity of the ruling classes. In order to bring the political and economic system in harmony with the demands of globalisation, Pretoria had to think of ways to dismantle apartheid structures. However, the legacies of colonialism and apartheid will continue to cast dark shadows on South African society in the post-apartheid dispensation as Pretoria addresses itself to national unity and balance of growth with equity.

Given common geo-eco system, South Africa's future is intricately linked with that of its neighbours. Any changes in the economic and political policies of Pretoria will have its effects on the neighbouring states who supply labour to South African mines and depend on it for import of capital, scientific and technical skills for industrial and agricultural expansion. SADCC could provide useful forum for joint tapping of the economic resource base in southern Africa. The field of power generation for example is of vital importance to the economic health of the region, and if hydro-electric potential is fully tapped through the co-operative efforts of all the states, it could fully meet the needs of the region and spare the coal used in generation of thermal power. With the lifting international sanctions and trade boycott, recessionary trends in the South African economy noticed during the last decade will disappear. The flow of foreign investments in South Africa will be resumed.

The changes introduced in the economic and political policies of Pretoria will affect South African labour market which is spread beyond its international borders. While presenting 1993-94 state budget South African government advocated setting up of market economy, use of labour-intensive methods of production, reduction in government expenditure, and low inflation rate for achieving higher growth rate. Over the years segmented development of South African society has led to unequal development of capital, skills and education among various societal segments. The levels of education and vocational skills of the majority community has to be raised before they could command economic power equal to that of the whites. The blacks could increase their control of economic resources through land redistribution and diversifying the location of industries, though ANCA has given up the demands of nationalisation of industries and equitable redistribution of the land holdings. South Africa needs a pragmatic approach for developing economic infra-

structure and the development and redistribution skills and wealth. Agricultural and rural development, development of labour-intensive industry and adoption of mixed economy are some of the measures needed to bridge the chasm between various segments of population. SADCC has a substantial role to play in mobilising capital, scientific and technical know-how from the regional and international sources and making the interdependence operational in the field of aid and development.

Unable to meet the domestic stress and strain created by the modernising process and the pressures of interdependence and globalisation, the nation-state is increasingly giving up some of its sovereign attributes through the establishment of co-operation with neighbours. These integrationist processes in a unipolar international relations having multiple focal points will increase state's bargaining power and enable to satisfy the rising expectations of the people. Keeping this in mind, African leaders have agreed to establish African Economic Community by the year 2050 AD. The political agenda of the southern African states should take advantage of the global changes and pool regional resources and skills for mutual advantage.

Down and Out in Outer Mongolia

Lessons for Economic Reformers for 1995

Rehman Sobhan

While eastern Europe has been the hardest hit because a system, put in place over many years, which had guaranteed the basic needs of the citizens, was dismantled in rapid order under the diktat of the IMF and World Bank driven by the western countries, the crisis of living standards posed by economic reforms is by no means unique to post-socialist Europe. As the world moves into 1995, what conclusions do we draw from yet another year of failure of market reforms to restore sustainable growth to most of the third world?

RECENTLY on CNN I watched a small item on Mongolia. It showed children abandoned by their parents for reasons of poverty, living in the sewers of Ulan Bator. It appears that in the golden age of the market economy, 25 per cent of the families of Mongolia have fallen below the poverty line which stands at a handsome US \$ 10 per month. As with most such encounters with the market reform process children bore the brunt of the degeneration into poverty of their families. These same children now huddling in the streets and sewers during a Mongolian winter had in the bad old days of Communist rule in Mongolia enjoyed guaranteed health care, basic nutrition, primary education and other basic necessities of life, including a roof over their head in a warm home, as a matter of right. Their parents had guaranteed jobs, a secure and predictable future. They however did not have shops full of imported luxury goods or fleets of luxury cars on the streets available to those who can buy them in the free market. Nor were their hotels full of the much sought after foreign middlemen and consultants who are now ubiquitous in Ulan Bator in search of a quick killing at the expense of Outer Mongolia.

Are Mongolians better off under market economics? Are its citizens better fed, housed, clothed than they were in the bad old days? Obviously UNICEF does not think so. In a recently published report, *Central and Eastern Europe in Transition: Public Policy and Social Conditions*, UNICEF reports on the decline in public services in the formerly socialist countries of Europe. The report presents some horrifying statistics about the declining standards of living of the 'beneficiaries' of market reforms. The report indicates that in 1992, 53.6 per cent of Bulgarian households lived in poverty. In Hungary, poverty levels in 1991 were 21.3 per cent compared to the pre-reform level in 1989 of 10.1 per cent. In the Czech Republic, poverty increased from 5.7 per

cent in 1989 to 18.2 per cent in 1992. In Poland poverty increased from 21.8 per cent in 1989 to 41.4 per cent (57.6 per cent of children live in poverty). In Romania poverty increased from 27.3 per cent in 1989 to 51.1 per cent in 1992 (70.1 per cent of children live in poverty). In Russia households in poverty increased from 5 per cent in 1989 to 43.8 per cent in 1992. (This assumes a poverty line of 75 roubles. If this poverty line is raised to 118 roubles the households living in poverty rise to 77.1 per cent.) In Ukraine poverty was 35.7 per cent in 1992 (assuming a Rb 118 poverty line). This is a small increase over 1989. In Slovakia poverty increased from 8.5 per cent in 1989 to 30.2 per cent in 1992 (41.3 per cent of children lived in poverty). Thus as in Mongolia all of formerly Socialist Europe has faced a rapid and visible increase in poverty following the move towards the market.

As a consequence of this deterioration in the conditions of life in formerly Socialist Europe, UNICEF reports that between 1989 and 1993 the crude death rate increased by 17 per cent in Romania, 12 per cent in Bulgaria, and by an incredible 32 per cent in Russia where the report states that yearly deaths in 1993 exceeded that of 1989 by 5,47,000 units. To further quote UNICEF on the crisis in formerly Socialist Europe, 'the spread of poverty, birth contraction, escalation of death rates, decline in school enrolments and an unstoppable crime wave have reached truly alarming proportions'. The homeless street children seen in Ulan Bator are now also common in Moscow and many other cities of eastern Europe. This is the by-product of rising levels of unemployment, liberalisation of the housing market and the cuts in social services due to budgetary austerity imposed under the IMF's various stabilisation programmes.

The crisis of living standards posed by economic reforms is of course not unique

to post-socialist Europe. Eastern Europe has been the hardest hit because a system, put in place over many years, which guaranteed the basic needs of its citizens in the form of full employment, education up to secondary level, basic health, nutrition, cheap but hardly luxurious housing, cheap transport, was dismantled in rapid order under the diktat of the IMF and World Bank who were driven by the compulsion of the dominant western countries to exorcise as rapidly as possible the spectre of Bolshevism which was seen to have been haunting Europe for these many years. The exorcists from the Bank and Fund have done a rather good job of it because they have managed to transform some of the former Communist *aparatchiks* into dollar millionaires by creating opportunities for them to maximise profits as black marketeers, currency racketeers, drug dealers, pimps and common or garden criminals, in the name of promoting market economics. This same class can now live in luxurious apartments, drive Mercedes, live on imported luxuries, holiday in Spain and drive past the huddled masses, sleeping on the snow-covered pavements of Moscow, to an evening at a night club where their bill would support five Russian families for a year.

VOTING ON REFORMS

Perhaps the Russians or Mongolians or Hungarians believe that economic stagnation, increasing poverty, extremes of income inequality are a fair enough price to pay for ridding themselves of Communism. I am no scholar of eastern Europe to argue about this. However, the current news reports on the politics of post-Socialist Europe indicate that in country after country regimes sponsoring hardline market reforms are being voted out of office to be replaced by 'reform socialists'. This has happened in Russia, Poland, Hungary, Bulgaria, Ukraine, Uzbekistan. No one would suggest that the electorates of these countries want Joseph Stalin to rise from his grave and restore his version of communism. But what they are voting for is against an externally imposed reform process, put in place without a shred of sensitivity to their inherited circumstances or minimal consultation with the local population about the nature of reforms which are acceptable to them. When the citizens of the 'reform' countries are consulted through the electoral process, they reply in the only way possible, by voting out of office the regime most actively promoting the reform process.

As I have argued in the past and will report in a forthcoming piece, the World Bank IMF sponsored reform process is in some

trouble around the world, not least in Bangladesh. Milk and honey are not flowing through our towns and villages in the wake of the reforms though they have enabled a small class of people in each of these societies to get rich beyond the dreams of avarice. Where the common people are consulted on this subject, they have voted against the reformers. In our neighbourhood, this was the message in Sri Lanka, Nepal, in the states of Karnataka and Andhra Pradesh in India.

This same message of uncertain economic gains is emerging from some Latin American countries, most recently in one of the great success stories of the reform process, Mexico. As is well known, Mexico runs a one-party state which ensures its survival by a system of electoral fraud far in advance of anything we have learnt in Bangladesh. This means that the reformers manipulated their victory in the recent presidential polls even though the reforms have done little to alleviate unemployment, poverty, inflation or even restore Mexico to the robust economic growth it enjoyed in the pre-reform period up to 1980. The spectacle of rural insurgency manifest in the uprising in Chiapas state, led by the Zapatistas, growing urban unrest and crime do not suggest that Mexicans feel they are on the threshold of becoming North Americans. The recent collapse in the Mexican stock market, where 'hot' money located in portfolio holdings left Mexico as fast as it had entered it, demonstrates the fragility of the reform process, and may serve as an object lesson to developing countries who become overly excited over stock market booms which follow in the wake of reforms. Mexico has now been forced to devalue the peso and raise interest rates which may expose its economy to both inflationary pressures as well as another dose of economic recession.

Other countries in Latin America have been far from successful in ensuring either sustainable growth or improved conditions for their populations. Venezuela, Bolivia and Uruguay have all demonstrated flashes of success only to see the economy move into decline and to face a thumbs-down for reforms from the voters. Few support-constituencies for the reforms have been mobilised. Thus the base for the reforms remains politically shallow and the process remains driven either by the foreign donors and creditors or by a few individuals supported by a small class of technocrats.

Africa is another area where reforms have hardly mobilised a strong constituency of supporters. Africa has been exposed to a decade of economic reforms, yet today it is disintegrating before our eyes. It would be unfair to assume that the crisis of Africa owes exclusively to the reforms which have conditioned their economic agendas for the last decade. But for nearly a decade many countries of Africa have functioned as

mandated territories of the World Bank run by the offices of the Resident Representatives of the Bank with foreign consultants involved in drawing up every single detail of the reform process. The Bank can today thus hardly disassociate itself from the mounting chaos in Africa. The externally-driven reforms process has in no small measure contributed to state disintegration in Africa by ideologically delegitimising the state, subverting its authority through imposition of externally mandated reforms. A reform process without domestic ownership has directly led to a decade of economic stagnation, and impacted most severely on the poor by cutting down on social expenditures in the name of stabilisation, whilst the ostentatious living of a class of new rich thrown up by the reform process serves as a daily provocation to the victims of reform.

WHERE DO REFORMS WORK?

As the world moves into 1995 we are left with success stories of reform which remain few and far between. We are left to celebrate the achievements of the regime of the Chilean dictator, General Pinochet, which thrived on mass murder and concentration camps, deprivation of basic human rights, the destruction of trade unions and created high levels of unemployment which persisted for over a decade. The suffering and oppression imposed on the Chilean people appears to have paid off as Chile seems to have made a breakthrough into sustainable growth and improved living standards. We have still to understand whether having a homicidal maniac as head of state is an essential variable for successful reforms or there are other contingent elements unique to Chile, which need to be identified to understand the basis of their success. I have this to specialists on Chile to answer. Argentina is held up as a promising reformer along with Ghana in

Africa but we have to still test the durability of these few success stories or to compute their social costs. Let us not forget that till yesterday, Mexico was being touted as the second Chile.

Thus as in all such debates we are back to east and south-east Asia as demonstrations of successful but more important, durable, reform models. But by now a great deal of literature has appeared questioning whether any of these Asian economies can be legitimately classified as countries which fully embraced the Bank-Fund agenda as their model for reform. What is certain is that each of these countries designed their own development models, their own pace for the reforms and drew upon Bank-Fund advice and resources only when it suited them. No country has retained control over its reform design more closely than the Chinese who have used the market, drawn in foreign investment and technology and yet kept intact many elements of the socialist system to the point where the US is still arguing for the continued exclusion of China from GATT. From this syncretic process, China has emerged as the fastest growing economy in the world over the last decade, destined to be a superpower in the next two decades.

REFORMING THE REFORMS

What conclusions do we draw from yet another year of failure of market reforms to restore sustainable growth to most of the third world? Do we wait one more year for the pay-off? This debate over the reforms has been underway from its inception in 1981/82. From 1985, when reforms were supposed to have yielded their rewards in restored growth and rising living standards, the millennium has been postponed year after year, until in 1995 we are still seeking more time for the pay-off from the reforms. We are told that reforms started late, that

they take time to work, that they are not being implemented properly, that there is backsliding. For each country special circumstances are cited. What no one is questioning is the basic validity of the reforms, the timing, the flaws in the design, the lack of democratic support.

To raise questions of this nature invariably invites the standard mindless response that the critics of reform want to restore the old system or want no reforms at all and continue to ignore what happened in the past. Such responses are no help in finding answers to the present outcome of Bank-Fund reforms, nor do they suggest what may be done to make such reforms work better. To accept such a rethinking on the reform process we have to recognise that in most countries of the world the reforms have *not* worked in terms of establishing robust growth in output, investment and living standards. Having high foreign exchange reserves, low inflation and balanced budgets is not and never has been the objective of any development process but it has been and remains a means to an end I have written all this before, for the last five years at least. The fact that I am writing it again at the beginning of 1995 and making the same proposition suggests that five years have gone by and we are still waiting for the goods to be delivered from the reforms. The only difference is that in these five years the world has become a much more dangerous place to be born with the very survival of many states now coming into question.

The principal reasons for the weak outcomes of the reform process originate in the flaws in design which excluded issues of governance from the core of the reform and placed them as a post-script to the reforms. Since the quality of governance dictates whether the reforms can be implemented, this omission proved a fatal flaw in the design as did the failure to clearly define the ends of the reform in a form which relates to the conditions of life of the people. Measuring performance under reform by GDP growth rates lacks the electricity generated by reporting every year on the number of people who graduate over the poverty line or become literate or gain access to good health care. However, even more important than the design flaws was the lack of domestic ownership over the reform process which meant that the constituency of support behind the reforms was always weak.

Is there any scope to rethink the reform agenda? Many would say there is little scope for this. In many developing countries even the principal opposition parties pledge fealty to the reforms. Many such parties do so not out of any genuine conviction but because they feel that in this unipolar world the patronage of the principal donors is essential to the ascension to power by any opposition

party. This genuflection to donor concerns sometimes leads to some quite pathetic spectacles of political parties once pledged to resisting donor pressures or even more radical agendas eating their words with unseemly gusto. This sort of mindless political opportunism unfortunately provides no guarantee from the donors that these parties now in opposition will be put in power since, notwithstanding the ostensible power of the donors, their capacity to promote a political outcome of their choice is grossly overestimated, as Ninian Stevens and his diplomatic sponsors in Bangladesh will confirm. Indeed such a preference for donor opinion over domestic concerns frequently alienates opposition parties from their potential voters who want political leadership to help them to challenge the unpleasant aspects of the reform process and to give the lead in the search for alternatives to provide for a domestically more sustainable set of policy choices.

What most third world polities need today is a more plural political system where voters are presented with clear policy choices derived from a robust domestic debate on reforms. Such a debate is likely to be far more serviceable to a genuine reform process rather than a synthetic consensus fabricated by the donors which lacks domestic credibility because it remains largely incomprehensible to both voters as well as the political leadership who support reforms not from a felt need but for its talismanic power to attract aid.

To seek a more creative approach to reforms demands that in each country debate must be joined over what we have gained from the reforms. Out of this analysis will come an understanding of the appropriate redirection for the reform agenda. This debate should be carried into the regional and international arena where the hegemony of the Bank-Fund design and its outcomes needs to be globally scrutinised since most countries have been exposed to a common programme of reforms and are, in consequence, facing similar problems.

ISSUES FOR PUBLIC DEBATE

Some of the issues around which debate over the reforms may be joined should address:

- (a) The impact of the reform process on growth of investment, output, structural change, living standards, reduction of poverty, human development, social stability, national cohesion, democratic practices.
- (b) If the results in (a) point to a deterioration compared to the pre-reform phase or falls short of its promise and expectations then we need to carefully diagnose the reasons. We have to look for design flaws and important gaps in the design,

such as the absence of a critical role for good governance, to ascertain whether the reforms were poorly implemented or were indeed unimplementable because of the design defects.

- (c) In the light of conclusions at (b), we can begin to put together, through a process of national debate and political consensus building, a domestically designed and democratically supported agenda which realises, within a time-bound framework, the following development goals:
 - (i) Elimination of poverty;
 - (ii) guaranteed health, education, security against old age, basic housing and clothing to all citizens;
 - (iii) secure livelihood to all citizens;
 - (iv) sustainable and more self-reliant economic growth;
 - (v) security in the daily lives of all citizens; and
 - (vi) guarantees to all citizens their right to elect their representatives without coercion and protection of their human rights.

These goals may be amplified or modified during public debate, but they must be defined as categorical objectives of development and politics. Any model of economic and political reform must be designed to realise these goals. Our development model must thus be designed not as an end in itself but as a variable instrument to realise the above goals. The model should be reviewed, modified, transformed if, when and wherever needed, through an ongoing process of national debate. There must be no sacred cows in the reform process, to be preserved for worship in spite of the evidence of non-performance under the reforms.

In most developing countries there is no readymade answer as to what are the reform alternatives. Only fools or knaves can claim a monopoly of the truth. What we need is to reach out amongst ourselves to seek creative answers both at the micro and macro level which can help us to reach the development goals we have set out above. My suspicion will be that different answers will emerge for different countries. Not a few of these answers would vindicate elements of the reform process put in place by the World Bank. But at the end of the day our own creative efforts, sensitive to our socio-political circumstances and commanding domestic political support, would need to be deployed to design a sustainable reform process. Neither foreign donors, however much they wish us well, nor foreign experts however competent (of whom many are far from competent) will solve Bangladesh's or Tanzania's or Nicaragua's or Mongolia's problems. I would hope this may be the enduring message for 1995. My fear is that this message will have to be repeated in 1996 as we live through one more year of stagnation, political instability and state disintegration.

Painful Transition

Arun Banerji

Transition to Market: Studies in Fiscal Reform edited by Vito Tanzi; International Monetary Fund, Washington, DC, 1993; pp vii + 387 with index, \$ 30.

THIS volume is a welcome addition to the contribution which the staff of the IMF has been making continually to elucidate a wide variety of financial matters pertaining to member countries, and releasing data which are often otherwise difficult to come across. The present work is part of a two-volume project. The first, *Fiscal Policies in Economies in Transition*, 1992, dealt with analytical issues in taxation, in public spending, in the creation of safety nets, in budgeting, etc. The present volume contains case studies in fiscal reform in 15 countries.

In addition to a valuable Introduction by Vito Tanzi, director, fiscal affairs department, IMF, the book is divided into four parts – the first two deal with Central and Eastern Europe, General and Specific Issues. Parts III and IV cover Asia and Africa respectively. Each of the 19 chapters, has an excellent bibliography.

Tanzi opens his Introduction by referring to an essay on 'Issues in the Reform of Socialist Economies' by Fischer and Gelb. They estimated that 'institutional' reforms and large-scale restructuring and privatisation would require 10 years and more for 'other financial market reforms'. Tanzi draws attention to an important aspect of the transformation process that deserves attention, viz, the complementarity or interdependence of institutions and skills in a modern economy.

Again, in a socialist economy, individuals, as individuals, have little influence on the allocation of resources, on the overall rate of saving, on the pattern of production, on the level and allocation of investment, on the rate of interest, etc. The annual plans constitute the key instrument. Even the financial markets, including the state bank, and public finance have a limited role. The transformation of these economies requires that the power to allocate resources shifts largely from the government to the private sector. It would also require the establishment of a financial and equity market, a market for labour, a market for the exchange of real property, a market for foreign exchange, and many other more specialised markets. In the area of public finance, Tanzi identifies and comments on five major building blocks for reform – setting up a tax administration; reform of the tax system; setting up budgetary institutions; reform of the public expenditure; and reform of the social security system. He concludes his essay with stating quite bluntly

that "to a large extent the success or failure of the transformation process will depend on how quickly modern fiscal institutions can be created". And this is not easy.

Since the book deals with no less than 15 countries in Europe, Asia and Africa, in this brief review we limit ourselves to three of these – Ved Gandhi's essay on Poland, one of the first among centrally planned economies to have committed itself, as early as mid-1989, to the adoption of market-oriented economic reforms; Mario Blejer's study of China, our mega neighbour to the north; and Dieter Bos on East Germany, primarily for privatisation.

As in other centrally planned economies, the state had numerous responsibilities in Poland, "each of which had important implications for the country's fiscal structure prior to 1989". Thus, the state played a dominant role as investor and producer – with major implications for the tax system, public expenditure policies and the working of the parastatal enterprises. The enterprise profits tax system became more of an ex post profit-sharing system. Second, the state controlled the prices of most inputs and outputs, and hence had to constantly monitor, and in fact frequently increase or decrease the turnover tax rates to clear commodity markets, and support unprofitable sectors unable to pay the legislated turnover taxes. It also called for massive outlays on consumer subsidies, and subsidies to industrial and agricultural inputs. Third, the state played an active role in incomes policy, particularly in determining wages in the socialised sector and incomes arising in the non-socialised sector, with important fiscal implications. Finally, the lack of market orientation of the economy affected macro-fiscal policy-making and budgeting.

A fundamental reform of the fiscal structure was, therefore, needed to transform the economy to a market-oriented one, as the state was about to shed its role as a major investor and producer, and as most existing socialised enterprises were to be privatised, the inefficient ones being allowed to go bankrupt.

Concluding the study, Gandhi states that the process of fundamental fiscal reform has been somewhat slow and uneven. This, he adds, is not totally unexpected. Drafting new tax laws, in the face of a vocal and multiparty parliament, and strengthening tax administrative capacity, when trained

manpower was short, have taken time. Shifting expenditure responsibilities on to local authorities, including many social assistance schemes, was simple, but ensuring their financial viability has taken a lot of time and effort. Carrying out fiscal reform in economies in transition, and doing it right, "is simply a laborious and time-consuming process" (p 107).

Starting in 1979, China has carried out wide-ranging economic reforms with the specific aim of accelerating the rate of output growth by increasing productivity and improving the allocation of resources. Blejer stresses the difference between the nature and design of the reforms in China from those in eastern Europe – the reforms in China were not aimed at fully or partially dismantling the socialist system. So the issue of privatisation of state-owned enterprises, as well as the more general problem of ownership rights, has not played a central role here. Instead, China introduced special arrangements in order to provide incentives similar to those prevailing in a predominantly private system. Secondly, the Chinese reforms were largely 'experimental' – concentrated in specific areas, beginning with agriculture, so as not to cause wide systemic disruptions. But they achieved the objective of accelerating growth and, in this manner, tended to overheat rather than depress the economy. Thirdly, the reforms were largely grounded on regional decentralisation which meant that the power of the central government to manage the system at the macro-economic level (including the ability to raise revenue) has been lost to local and provincial governments. Lastly, unlike elsewhere, the Chinese reforms were started and proceeded over a long period in an environment of (at least apparent) macro-economic stability. China provides the longest continuous instance of a reforming socialist economy.

Radical reforms in agriculture – ending the commune system, allowing larger private plots, and legalising informal markets for farm products in rural areas raised the rate of growth in agriculture from an average of about 2 per cent a year during 1958-78 to about 8 per cent in 1979-84. Higher productivity displaced labour from this sector, but migration to cities was prevented by eliminating restrictions on non-agricultural activities in rural areas, leading to many township and village enterprises. These latter accounted for nearly one-fourth of the gross value of industrial output, and employed about 17 per cent of the labour force by 1987 (p 254).

A significant price reform was to introduce a two-tier price system, first in rural areas. Producers could sell their output, above a

set quota, at free market prices. This and other reforms raised aggregate growth to unprecedented levels. But without strong financial policies, aggregate demand rose greatly, and so did wage and bonuses to employees worsening the budgetary accounts and macro-economic discipline. The revenue/GDP ratio fell steeply, though this was partly intended. The expenditure/GDP ratio too fell, including, Blejer states, a sharp fall in defence spending. (The GDP/expenditure ratios are presumably at current values. In a period of inflation, especially as its impact will vary from sector to sector, the changes in these ratios are not easy to interpret.) One cannot also say how far this fall in defence outlay was real, as most states hide various defence outlays under a variety of civil heads.

In sum, the central elements of economic reform in China have been to grant greater decision-making powers to enterprises and to enhance the role of market forces. "while preserving the basic framework of socialist ownership" (p 267). Fiscal policies, however, must play an important role in hardening the budget constraints during the transition from a centrally planned system. This calls for a compromise to solve the conflict between the decentralisation of decision-making and the maintenance of macro-economic control and flexibility.

It is a little surprising that the one article on East Germany is mainly concerned with

only one issue, privatisation, on the plea that privatisation of viable firms is an important step in the transition of the industrial sector from planning to market orientation – a central problem facing East Germany after German unification (p 202). Debates on this issue since 1991 have raised a number of thorny issues, including the capabilities and bias revealed in the operations of the special body managing this business. On the vital matter of restructuring, i.e., preparing firms for privatisation, the author has argued that "under political pressure" that body would try to preserve firms that should be liquidated, because "restructuring is often used as a label to disguise subsidisation of non-viable firms" (p 218).

Gerd Schwartz's article on 'Privatisation in East-European Countries' (chapter 12), speaking of preliminary policy lessons, emphasises that for privatisation to be successful, financial sector reform is crucial. It needs also the rapid creation of a legal framework that defines ownership rights clearly to facilitate public understanding of privatisation, stimulate broad-based ownership (to help formulate incomes policy), and prevent abuses of power. It is not clear to what extent these policy desiderata have been met in East Germany.

To appraise a work as the one under review is difficult. We miss in it the role of the IMF – but that is perhaps to be expected. We are not told, except indirectly, the costs and benefits of the Chinese effort where the

basic socialist system has still been maintained largely intact. This too is perhaps natural in an official publication of the IMF, though in other chapters views have crept in on this matter, which are in no sense veiled. Nevertheless, it is a valuable, thought-provoking, work, throwing light on what is happening in the fiscal sector in erstwhile socialist economies.

The serious issues, conceptual and administrative, which are arising in these countries in their transition to market have reminded us of the problems, perhaps no less serious, that India is presently facing in an all-out effort in liberalising the economy. Inevitably, the thought also comes of how many millions of ordinary people have suffered, and are still suffering, from the operations of wrong economic policies in these countries and in India. Investment has fallen behind, powerful vested interests have grown, the so-called rentiers, who are today blocking change, and foreign interests have acquired large influence. The rich have become richer, and the poor poorer, with no prospect of the gap, domestically and internationally, narrowing in the foreseeable future. Unfortunately, the words 'market', 'globalisation' and the like are fast degenerating into mantras of a creed, much as the earlier 'socialist economy', leaving no room for exceptions, nuances or grey areas of genuine doubts or uncertainties. Reason, once again, risks being a casualty.

'Development from Above' and Its Victims

Carol Upadhyia

Contours of Continuity and Change: The Story of the Bonda Highlanders by Bikram Narayan Nanda; Sage Publications, New Delhi, 1994; pp 228, Rs 275.

ARGUABLY the central problematic of anthropology over the last two decades (or more) has been the transformation of pre-capitalist societies by their incorporation into the larger capitalist world-system. This is the theme of B N Nanda's book on the Bonda of highland Orissa (Koraput district). His object is to delineate precisely the changes that have occurred in this 'tribal' society consequent upon the intrusion of the state and the market. He writes that this is not intended to be a 'monograph' about an Indian tribe, but should be read as a collection of essays; yet the diverse chapters read together become much more than either, for they provide a comprehensive picture of the Bonda today and, more than that, a view of the larger society from the perspective of the highlanders. The book is based on Nanda's 1982 dissertation plus research carried out during later field trips.

The Bonda highlanders, who according to the author still enjoyed a somewhat self-sufficient, independent existence in the early 1970s, are now well on their way to becoming an agricultural society based on wage labour. It is the increasing dominance of wage labour – which has been introduced mainly by the state through its agent, the Bonda Development Agency (BDA) – that Nanda identifies as the motor of change in the highlands, signalling the historic shift from production for use to production for exchange. The 'traditional' subsistence economy – based on shifting cultivation; irrigated rice cultivation on terraces, hunting and gathering – is described in detail and then analysed in terms of Meillassoux's theoretical framework. According to Nanda, traditional Bonda socio-economic organisation conforms to Meillassoux's 'domestic community' type. A central feature of the Bonda 'domestic community' is a form of co-operative labour called 'odja', which has been largely replaced by the wage labour form ('buti') over the last decade or two.

There is no single mode of production in the highlands at present; Nanda employs Terry, Bernstein and Godelier to analyse the "collage" of production systems and their interpenetration. Household subsistence production persists so that wage labourers are not entirely divorced from the means of production, but the very nature of the penetration of the wage economy is such that it feeds on the subsistence economy. This process is mediated by government-sponsored development programmes which encourage producers to switch from subsistence production to production for exchange. Market forces undermine the

subsistence economy in two ways – by withdrawal of labour from subsistence production, and by the monetisation of some of the elements of reproduction, which forces producers into the wage economy. The destruction of the forests and the subsequent decline in the productivity of shifting agriculture is both a consequence and a cause of wage labour.

One wonders why Nanda privileges the commoditisation of labour over commoditisation in general as the transformative factor. One reason is that for him, odja (collective labour) is "...the heart of subsistence production in a domestic community" (p 84); this 'heart' is being torn out by the wage labour form and with it, the domestic community is being destroyed. Odja is more than an economic form; it is a symbol of the 'organic unity' of the domestic community: "To participate in an 'odja' is a hallmark of... citizenship in the village... Such reciprocity of labour reproduces the cohesion of the group..." (p 83). Odja is a normative system that emphasises the solidarity of the community, while buti "initiates the imperatives of an individualistic money economy... Penetrated by the symbolic order of wage economy, the domestic community undergoes a kind of haemorrhage of the spirit of traditional solidarity" (p 89). Not only work itself, but the perception of work is altered: "Such is the ideology of wage that it disparages all work that does not earn wage as mere waste" (p 89).

This view of the depredations of wage on the spirit of the domestic community is carried through in the chapters on the concept of time, education and medicine, and the development bureaucracy. To explore how the economic shift impinges on the mind, Nanda focuses on the concept of time. When land becomes the object rather than the subject of labour, and labour itself an object of exchange, there is a qualitative change in the sense of time. For the Bonda, time is linked to the rhythms of subsistence production and reproduction – it is task-oriented and cyclical, and 'work' and 'leisure' are intermingled. With the emergence of a wage economy, leisure and work are separated, for time becomes valuable; work is time-governed and time becomes linear. The persistence of the subsistence economy within the emerging wage economy means that there is a conflict between their associated concepts of time; to understand the modern 'myths of development' the highlanders must first fully internalise the linear notion of time.

The pushing forward of the 'economic frontier' is accomplished with the aid of

institutions whose role is to further the commoditisation process. Employing the works of Foucault and Ivan Illich, Nanda dissects two such institutions – the school and the clinic (PHC). In the 'ashram' schools funded by the government, students receive an 'education' that bears no relation to the reality of their lives and that clearly conveys their subordinate position in society. In the process of becoming 'educated', Bonda boys forget or fail to learn the skills of the subsistence economy. "Under the prevailing pedagogy, the symbolic patrimony which a Bonda child inherits, perishes. In order that the symbols of the market and its ideological representations are meaningfully lodged over the symbols of subsistence, the tribe must be declared *backward* and *primitive*" (p 175, emphasis in original). Like the school, the modern clinic is 'mystifying' and 'culturally alien' to the Bonda, and the discourse of disease offered, like the school syllabus, has little relevance to their lives or needs. Equally absurd is the concept of family planning for people whose labour is the only source of wealth. Those who 'accept' sterilisation do so only for the cash incentive, and Nanda raises the important question of whether, in a situation of acute poverty, there is any difference between incentive and compulsion.

Thus Nanda covers much ground in this slim book, employing a variety of theories along the way, which is perhaps its greatest weakness. Curiously juxtaposed to the rather Durkheimian account of 'traditional' Bonda society and the simultaneous employment of a materialist evolutionary scheme is the first chapter on the social history of the highlands. If, as Nanda shows, there was a 'steady intermingling' of tribal and non-tribal cultures in early Orissa history, and 'Hindu' kingdoms were greatly influenced by the 'tribes' which formed a large part of their populations, does it make sense to speak of the Bonda as an 'independent', 'self-sufficient' community? Nanda implies that the later history of Orissa led to the isolation of the highlands people, the condition in which they were found by 19th century (British) ethnographers. He also shows that the opening up of the highlands under colonialism was mainly via trade; the process of decline of the subsistence economy began early with the entry of traders, money-lenders and cash, including wage labour. The tribal revolts starting in the 1890s demonstrate the extent to which highlands societies had been affected by colonialism. Given this, how are we to believe that the real "demise of the domestic community" is of much more recent origin, as he suggests?

These contradictions stem in part from Nanda's rather uncritical use of Meillassoux's evolutionary scheme, which also leads him to posit "... the survival, in different social layers, of many cultural forms that could allow the reconstruction of earlier stages of social organisation and their articulation"

(p 23). Such evolutionism ignores the recent debate in anthropology, stemming from a recognition that even 'peoples without history' have histories, or whether modern hunter-gatherer societies are examples of an earlier form of social organisation (the band) that has survived, or are in fact products of a history of interaction with other peoples that has pushed them into a marginal existence. It also contradicts Nanda's own plea for a history and sociology of Indian tribes that employs both of the central components of Marxism – historical materialism and critique of political economy: "If we are to take Marx's own works as revolutionary and not as a revelation, then we ought to recognise that every category of society and history belongs to socio-historical conjunctures" (p 21, fn 7).

These minor objections do not detract from an appreciation of the depth and complexity with which Nanda has handled his theme, and of the fact that he goes beyond anthropology and takes an advocacy role. Nanda places himself squarely on the side of the highlanders and other 'subsistence' peoples whose cultures, societies, and livelihoods are being swallowed inexorably by the incursions of capital and the welfare state. He recognises that his critical stance on 'development' invites the charge of nostal-

gic longing for an illusory idyllic tribal past. Yet his account leaves little doubt that even if the highlanders' life was not easy in the past, it has been made infinitely harder now, not least because of the depredations on the 'collective mind'. The discourse of development imposed from above not only robs the Bonda of their economic independence, but subordinates them within society and totally devalues their culture, their world-view, their way of life. Moreover, this transition has denied to the highlanders the possibility of understanding objectively their situation: "Between their attitude to their circumstances and their material conditions falls the veil of diabolical development" (p 208).

Nanda's scope is much wider than the Bonda; in this slim volume he manages to raise and contribute to issues central to life itself at the end of the 20th century. "As the Bonda socio-economic organisation gets absorbed by the modern state, one more society which could potentially point to an alternative future will be lost to us" (p 14). His masterful evocation of the Bonda community and its collective mode of organisation, and its contrast to the class-stratified, patriarchal, consumerist society into which it is being integrated, should give pause to the votaries of 'development', both official and otherwise. He puts the dilemma

succinctly: "Without altering the power of the planner over the people, no real progress can come about in the highlands. ... Real change ... has to do with a change in our way of thinking about ourselves and our consumerism, which devastates the ecology of the forest people" (p 195).

This book should be required reading not only for anthropologists but also for those concerned with 'development' of all kinds; for it is not just about the destruction of indigenous peoples but the potential destruction of all life by the engine of capitalist production. His writing, although dense at places, is a pleasure to read, for his imagery evokes the processes of change in the highlands in a way that dry ethnography cannot. If I have used too many quotations in this review, it is because it is often difficult to express the thought as well as has Nanda. This book, which came out just one day after Nanda's untimely death, proves that his demise was truly a tragedy, for it shows that he had much more to give to social science and to the cause of indigenous peoples. It is to be hoped that his students will carry on his work and contribute to the construction, as he advocated, of a "scientific discourse that is free from patriarchal-class bias which pervades the paradigms of planning" (p 195).

SAGE PUBLICATIONS

*A major event in social science publishing!
All six volumes now available at a Special Indian Price!*

INTERNATIONAL HANDBOOKS OF QUANTITATIVE APPLICATIONS IN THE SOCIAL SCIENCES

Series Editor: **MICHAEL S LEWIS-BECK**, University of Iowa

Each Handbook, comprising five Quantitative Applications in the Social Sciences volumes, is available at the **SPECIAL INDIAN PRICE** of Rs 695. (Each QASS volume is priced at \$ 9.95 or approximately Rs 325). Individual Handbooks will appeal to a wide variety of academics, practitioners and students in the social sciences. A complete set of Handbooks will form an essential foundation for any library of social science methodology.

Political Economy, Agrarian Question and Comparative Method

Terence J Byres

In this paper the case for classical political economy, and especially its Marxist variant, as a means of analysing the problems of economic development is argued. Three major characteristics of classical political economy are identified: accumulation, class and the state. The agrarian question is considered, and the significance of these in its analysis is posited. With the agrarian question in mind, the importance of the comparative method is urged. Some problems associated with the comparative method are considered, and, in the political economy context, the strength of the case-oriented rather than the variable-oriented variant of the comparative approach is stressed.

I

Introduction

IT was put to me recently that 'political economy is dead'. But which one? There are, of course, two quite distinct and fundamentally opposed forms of political economy. Let us call them the 'old political economy' and the 'new political economy'.

The former, broadly construed, is in the tradition of classical political economy: a line running from Adam Smith to Karl Marx. There is, I would submit, more than enough in common to justify such a broad classical grouping. To that I will return. But there is also a clear line of division, within the 'old political economy', between a non-Marxist and a Marxist variant. The more recent practitioners of both variants include a number of very distinguished economists and social and economic historians.¹

The 'new political economy' is a branch of neo-classical economics which "applies the basic economic logic of constrained choice to circumstances in which private transactions fail to maximise welfare" [Caporaso and Levine 1992:86]. It addresses market failure, and, within a property rights framework, focuses upon externalities, public goods and monopoly.² I shall say no more about it. It is not my kind of political economy.

It was the Marxist brand of the 'old political economy' whose demise was announced, although its non-Marxist variant has also long since been declared dead. Concentrating on the former, the statement is in line with similar pronouncements to the effect that 'Marxism is dead'. Or if not dead, it is about to go: a recent piece in the *Guardian*, in which an interview with Eric Hobsbawm was reported and his most recent book noted, described him as 'the last Marxist'.³ I was glad to read that during the interview Hobsbawm was "sipping malt whisky"⁴ (although which particular one was not revealed). The final days of Marxism in the

west, it seems, are at least characterised by good taste.

II

Political Economy

Let us, however briefly, consider political economy, or at least certain characteristics of it germane to my broad concerns as a development economist, and to my interest in the agrarian question. There are three aspects that I would draw to the reader's attention: accumulation, class and the state. In emphasising these three aspects, I am, of course, oversimplifying for present purposes.

As Lewis stressed, at the heart of classical political economy lies a preoccupation with capital accumulation and its determinants.⁵ That is my preoccupation. But why? To answer that we must first identify the nature of the accumulation. I have mentioned Arthur Lewis. If I might quote another great economist – a political economist of quite remarkable breadth and power – Maurice Dobb, such 'accumulation' is not "the mere piling up of durable objects of wealth", such as "barren precious metals and durable consumer goods", but, rather, "the constant creation of new means of production". It requires, in both town and country, the diversion of wealth, or surplus, on a regular basis, away from such forms as its primary expression (its disaccumulation in those forms) and into "real capital and ... productive investment" [Dobb 1967: 27].⁶ That entails a dramatic and fundamental change of practice among those who appropriate surplus, whether in the form of profit or rent.

This, for the classical economists, was a central condition for, a defining characteristic of, development. Again to quote Dobb, for Ricardo and Smith, for example, "the progress of capital accumulation was the constant goal of endeavour and the guarantee of material prosperity for the community at large and for all classes" [Dobb 1973:87].⁷ or, in another phrase, that of Ronald Meek, "the Classical economists... regarded... the accumulation of capital as the key to the

growth of wealth and abundance" [Meek 1973:33]. It had to proceed. It was Ricardo's fear that, consequent upon downward pressure on the rate of profit, "there would be no motive for accumulation", and it might come to a halt [Ricardo 1951:122]. For Marx, accumulation of capital (or 'expanded reproduction') is capitalism's historic mission, and its central dynamic. It is this which, once it becomes established, and shifts from a constant to an increasing rate, transforms a poor economy. It is the driving-force of capitalist transformation. This classical stress upon accumulation is as valid now as it was when they wrote. We must seek to understand how it comes about and what might prevent it. My postulate is that, to do that, one must seek its agrarian roots. This is a crucial dimension of the agrarian question. To it I will return.

I have referred to 'classes'. As Lewis, perhaps, did not emphasise enough, at its most powerful classical political economy is an analytical tradition within which social class is central: there is a remarkable continuity from Smith's 'three great orders of society' [Marx 1962:862], through Ricardo's 'three classes of the community' [Ricardo 1951:5], to Marx's 'three big classes of modern society' [Marx 1962:862]. It was a cardinal precept that the rate of accumulation, and, by extension, the speed and the nature of the capitalist transformation of a society, depend upon the social character of those who accumulate, i.e. upon their class characteristics. In this tradition, I would postulate that one cannot understand the roots, the causes, the dynamic of capital accumulation without a treatment of class: without careful examination of class structure, class relationships, and class conflict. It is a part of the classical tradition that is all too easily lost, even by economists who see themselves in that tradition. It is integral to treatment of the agrarian question.

In the political economy which I practise, analysis of the state figures centrally. My next postulate is that class analysis must be accompanied by – must include – treatment

of the state. Class analysis requires this, inasmuch as dominant classes (or classes, emerging but not yet dominant) may need state intervention at certain decisive moments. Moreover, their dominance, once secured, may have to be underpinned by the exercise of state power. There is a current orthodoxy, to the effect that 'development' requires that the state must be 'rolled back'; that all that is necessary is 'to get the prices right'. This seems unlikely from the perspective of political economy, both in the context of the agrarian question (I shall argue) and more generally.⁸ To anticipate, political economy suggests that where the agrarian question has been resolved it is likely that the mediation of the state will have influenced critically the manner of that resolution.

We note, then, our concern with the nature and activity of the state in relation to the agrarian question. It is impossible to consider the relevant issues without reference to the state. There is, however, a danger to be avoided. This is the trap of seeing the state as a kind of 'black box': a closed unit which can be studied by registering class input and reading off predetermined class output. Statements about the state may then reduce to simple tautologies. I would wish to resist a view of the state as a kind of residuary hypothesis, to be resorted to mechanically in order to explain particular outcomes. The state, and the perhaps complex class interests which it represents, need to be examined with the closest scrutiny, rather than simply reached for routinely, however difficult such scrutiny might be.

III Agrarian Question

Let me now turn to the agrarian question.⁹ What is the agrarian question? Why is the agrarian question important? I hope the reader will bear with some brief personal history, which allows me to answer those questions and to identify certain intellectual debts.

My concern with the agrarian question started soon after I came to the School of Oriental and African Studies (SOAS) in 1962, and from the outset it has focused on India. Most of what I have published has been on India: in SOAS I am an economist specialising on the Indian economy. I would like to express here my delight at having been able to work so closely on India for all these years. The intellectual curiosity exhibited there, the uncompromisingly high intellectual standards encountered, the excitement of controversy passionately and skilfully pursued, the constant intellectual challenge, the sense of intellectual exhilaration, have been immensely stimulating and rewarding. It has, indeed, been a great privilege. I can think of no other country which would have yielded such

high intellectual rewards (not to mention personal friendships).

It was an Indian economist, and friend, S C Gupta, who in April 1963¹⁰ first engaged my interest, when he gave me off-prints of two articles on Indian agriculture which he had published in 1962 [Gupta 1962a, 1962b]. These I read carefully. As it turned out, he was, in writing those articles, quite clearly the most important 'precursor' of the famous mode of production debate in India, that erupted some 10 years later.¹¹

I have been trying ever since I read his articles, to address the questions raised by him. They were, of course, questions raised previously by others, but never with such a sense of relevance in relation to India. This, moreover, was my first real exposure to them.

The issues he addressed related, in essence, to the extent to which capitalist farming was developing in India. The agrarian question, then, is constituted by the incomplete development of capitalist agriculture. The relations of production remain 'backward': a labour force free in the double sense (free of the means of production and free to sell its labour power) has not yet emerged fully. Agriculture, further, continues to be technologically backward, with consequent, continuing low levels of output, productivity, and surplus. The agrarian question is resolved only when capitalist relations dominate agriculture. Its analysis is concerned with whether capitalism can develop in the countryside, if it can, the extent to which capitalism has developed; the forms which it takes (which may be diverse and unexpected), the social classes or classes which are the major agents of change; the barriers which may impede its development, and the strength of those barriers.

More specifically, the issues addressed by S C Gupta were dynamic questions – questions of change – *inter alia*, of land concentration and whether it was proceeding; of the success or otherwise of action by the state to secure land reform and so clear the way for capitalist agriculture; of peasant differentiation and the possibility of 'peasant capitalism' ('capitalism from below'); of the continuing significance of landlords and the possibility of 'landlord capitalism' ('capitalism from above'); of the extent of wage labour and whether it was growing; of the nature of the productive forces in agriculture, and their transformation (and whether mechanisation was proceeding – and was, indeed, necessary) – again an area of crucial intervention by the state; of the inverse relationship between land size and land productivity – which had just surfaced as an issue, as a result of a remarkable article by A K Sen [Sen 1962] – which gave rise to the inverse relationship debate and which raised the possibility of a productive agriculture based on small holdings and

family rather than wage labour. They related, clearly, within agriculture, to accumulation, class, and the state: those issues at the heart of classical political economy, which I have already noted. Thus started my preoccupation with the agrarian question in India. And the issues I have mentioned remain as relevant now as they seemed in 1962.

My interest in the agrarian question has also been more general. To grasp and to understand the agrarian question in India (or anywhere else), I believe, requires a clear historical sense, theoretically-informed, and allied to an awareness of the need to view India in relation to other societies and other experience. I subscribe most strongly to the methodological principle that one cannot possibly understand the agrarian question – or any other important matter of that kind – without history, without theory and without a comparative perspective. My activities as editor of the *Journal of Peasant Studies*, which I helped start in 1973, have constantly reinforced, and informed, that view. I took to the *JPS* my Indian concerns, and we have published much excellent material on India; and I have gained from the *JPS* immeasurable insight into the agrarian question in India.

With the passage of the years – in part with the benefit and stimulus of the debates which have raged in India and in part with the insight gained from editing *JPS* – those questions addressed by S C Gupta have seemed to me to be increasingly complex and to be possessed of no easy answers: for India or for anywhere else, either historically or now. Moreover, as my struggle with them continued, I was seized of two growing convictions, which made their analysis the more demanding.

The first is that we need to reach for a wider reading of the agrarian question. We must seek to capture the tendencies at work in the countryside. That must remain at the heart of consideration of the agrarian question. But the implications for accumulation outside of the countryside need to be part of our analysis. Such a position finds warrant within the classical tradition. Smith stated the dependence of accumulation in industry upon the flow of an agricultural surplus, succinctly and with characteristic clarity.¹² Smith was obviously aware of the possible significance of the terms of the transfer, but he did not develop this as a possible rock upon which accumulation in manufacturing might founder. It was left to Ricardo to analyse that [Ricardo 1951].¹³ A general downward pressure on the rate of profit, he feared, would derive from a decline in the rate of profit for capitalist farmers, communicated inexorably to manufacturing, so bringing accumulation to a halt. Marx, in considering 'primitive accumulation', gave a powerful treatment of how the free wage labour necessary for accumulation in both

country and town is created in the countryside.

My argument is that these processes, and others central to accumulation in manufacturing industry, are powerfully conditioned by whether the agrarian question is resolved and how it is resolved. Clearly, such accumulation cannot proceed without some appropriate tapping of the relevant domestic sources of accumulation. These, to a considerable degree, must reside in the countryside in the early phases of transformation. Foreign sources of accumulation may be possible (in the past colonial surplus appropriation was significant). But these cannot dispense with the need for domestic agriculture as something of a 'nutrient base'. We need to examine 'voluntary' flows of surplus, appropriation of surplus by the state via taxation, and the inter-sectoral terms of trade. We must also examine, *inter alia*, agriculture as a market and agriculture and the making of an urban working class. Accumulation in manufacturing will depend critically upon these processes. They, in their turn, find an important part of their determination in the countryside. That needs to be seen as part of the agrarian question.

The second conviction came from growing unease about the constricted and analytically impoverishing way in which the agrarian question in contemporary poor countries is handled within the political economy tradition. This, I hasten to add, has been as true of my own work as of the generality of work in this area. It is so in the following way.

The prospects are considered of a limited number of possible 'paths' of capitalist agrarian transition: a set of paths which have already been traversed successfully in the past. The apparently essential features of these paths are identified and made to constitute models – historical/analytical models – of agrarian transition. These 'models' have been influential in two significant senses. Firstly, certain crucial interventions have been made, both in the colonial past and in the post-colonial era, in apparent conformity with them; while some are at present used prescriptively. Secondly, current realities in poor countries may be judged against them: they embody criteria by which one may judge whether, and in what form, a capitalist agrarian transition is being negotiated.

Practice in this respect may be defective in two ways. The first is that the paths in question – the 'models' being taken to contemporary reality – are too few. The full range of historical instances of successful transition is not referred to. Secondly, the conception of these paths is too stereotyped and too narrow. With these models as reference points, the processes at work may be seriously misunderstood: they may not

be fully recognised, or they may even go wholly unrecognised, because a set of limited and rigid criteria are not met.

It appeared to me desirable to establish thoroughly what was involved in certain major paths of agrarian transition, before bringing stylised versions (i.e. 'models') to bear upon contemporary poor countries as standards of judgment. If we are to use such 'models' as embodying criteria by which to judge whether or not agrarian transition is proceeding and to establish the nature of that transition, we incur a responsibility: to establish the exact contours of the relevant paths and to consider the processes at work in each case. Before committing oneself to conclusions about whether or not variants of a particular path are being followed, or may be followed, we need to be sure that we do not proceed from a caricature. We need, further, to avoid the analytical closure involved in assuming that the few 'models' we have in mind exhaust the relevant possibilities. Such was the impulse which led to the work in comparative political economy that I have been pursuing. The paths chosen for consideration suggested themselves easily enough. Analytical influence and possible relevance determined choice. Here were countries from whose apparent history influential models have been abstracted, or whose history seemed relevant: England, Prussia, France, North America, and Japan.

Let me sum up my view of the agrarian question. We may say that an unresolved agrarian question is a central characteristic of economic backwardness. In its broadest meaning, the agrarian question may be defined as the continuing existence in the countryside of poor countries of substantive obstacles to an unleashing of the forces capable of generating economic development, both inside and outside agriculture. It represents a failure of accumulation to proceed adequately in the countryside – that unpinning powerfully upon the town; an intimately related failure of class formation in the countryside, appropriate to that accumulation; and a failure of the state to mediate successfully those transitions, which we may encapsulate as the agrarian transition. It is that broad meaning that I maintain. My central argument is that the nature of agrarian transition not only has implications for the fate of the countryside, but has a decisive influence upon the pace, manner, limits, and very possibility of capitalist industrialisation. My focus, then, is upon agrarian transition and its central place in overall capitalist transformation.

It is this which I have sought to examine historically. Let me, in the final part of this paper, turn to some considerations on the comparative method, induced by my wrestling with comparative/historical political economy. In so proceeding, I have

certain sets of interlocking questions in mind.

The first relates to class relationships and is two-fold. It is, firstly, to capture the precise nature of the class relationships which emerged in the countryside in certain important instances of transition; and the second to disentangle the logic of why particular kinds of resolution of the agrarian question, in that sense, proceeded. Clearly, in examining the nature of any individual path of agrarian transition it is essential to identify the particular class structure which characterises it. This distinguishes a particular path of agrarian transition. The diversity of resolution in this sense is striking. But what are the implications – both in the countryside and outside – of this diversity of resolution?

My second concern is to identify and explain the forms taken by the productive forces in the countryside – if you like, the form of technological transformation. A very narrow reading of the agrarian question is concerned largely, if not exclusively, with class relationships. A fuller reading should include the outcome with respect to the form taken by the productive forces. This is crucially important. We cannot identify a particular path without reference to this outcome. It is an essential characteristic of each distinctive path. As with the emerging class structure, the diversity is considerable. Again the nature of mediation by the state must be investigated.

IV

Comparative Method

There is an established and constantly revitalised corpus of comparative work in the social sciences: including work by political economists, economists, political scientists, sociologists, and historians. It has many distinguished practitioners: Marc Bloch (certainly one of the very greatest), Barrington Moore, Perry Anderson, Robert Brenner, Theda Skocpol, Immanuel Wallerstein; among economists, Colin Clark, Simon Kuznets, Hollis Chenery and Moses Syrquin, and my colleague, Massoud Karshenas (whose book is about to appear [Karshenas 1995]; not to mention Marx and Weber. And there are many others. Comparative history has, perhaps, been especially exciting and fruitful.

Systematic comparative analysis is a distinct branch of enquiry, with discernible general goals and identifiable, if debatable, methodological principles. It has distinct variants, whose procedures differ markedly: their particular espousal depending, in part, upon the discipline and the aims of the comparativist. Nevertheless, it entails, I think, a comparative method, given early powerful statement by Marc Bloch in 1928 [Bloch 1967].¹⁴ It is that comparative method I have sought to deploy in my own work. There exists a useful interpretive and critical

literature on the comparative method.¹⁵ That I will make no attempt to consider. Rather, on the principle of learning by doing, I will draw upon my own recent experience in trying to apply it.

The authors of an influential work on comparative economic development, two economists, Chenery and Syrquin, make part of the case for the practice of the comparative method – in economics – as follows:

Inter-country comparisons play an essential part in understanding the processes of economic and social development. To generalise from the historical experience of a single country, we must compare it in some way to that of other countries. Through such comparisons, uniform features of development can be identified and alternative hypotheses as to their causes tested [Chenery and Syrquin 1975:3]

Barrington Moore, who has written one of the classics of the comparative approach, a magisterial and powerful work of comparative history [Moore 1967]¹⁶ also argues the value of a systematic comparative approach.

In the effort to understand the history of a specific country a comparative perspective can lead to asking very useful and sometimes new questions. There are further advantages. Comparisons can serve as a rough negative check on accepted historical explanations. And a comparative approach can lead to new historical explanations [Moore 1967:xiii].

The arguments made in favour of the comparative method are very similar. Yet, they are made by exponents of two approaches to the comparative method which differ markedly in their analytical procedures.

We may identify the broad nature of the differences. Although there have been many, differing ways of pursuing comparison, among a variety of authors, I concentrate on these two approaches partly because of the exigencies of space; but also because one might argue that these are the two archetypes: of which we can find either examples, variants or attempted combinations.

Chenery and Syrquin, with structural change as their central concern (in this respect, following, avowedly, in the tradition of Simon Kuznets [Kuznets 1956-67 and 1966]), practise a particular, and well developed, form of comparative analysis: that based upon cross-national data sets, using econometric analysis in order to test, for a large number of countries (in their case, 101), various hypotheses, and to establish, rigorously, certain generalisations [Chenery and Syrquin 1975:3]. This has been identified as the variable-oriented approach [Ragin 1987: ix and passim]. It is commonly practised in the social sciences; being part of "the trend in mainstream social science towards the application of ever more sophisticated multivariate [statistical] techniques to all types of social data" [Ragin

1987: viii]. That it can be powerful and illuminating is clear. It is especially valuable in establishing those 'uniform features of development' to which Chenery and Syrquin draw attention.

Barrington Moore 'discerns' and seeks to explain "three major historical [political] routes from the preindustrial to the modern world" [Moore 1966:xv]. He proceeds via a limited series of carefully conducted case studies (in his case six),¹⁷ each one taken separately, and he then makes the comparison 'carefully on a basis of the case studies. This, the case-oriented approach [Ragin 1987: ix and passim], seeks significant depth of treatment. By its very nature, the number of case-studies is strictly limited. These must be appropriate to the questions being addressed. They need to be truly comparable. They need, therefore, to be chosen carefully. The potential analytical power of such an approach, and the immense insight that it may bring, are obvious.¹⁸ It is particularly suited to qualitative analysis, although it does lend itself, also, to rigorous quantitative/econometric treatment (as Karshenas's recent work shows [Karshenas 1995])

Let me now return to the agrarian question. In considering it, we need to make certain analytical judgments. These – as we probe accumulation, class and state – fall into broad categories. They concern, firstly, the nature of performance, and what constitutes satisfactory productive performance. They relate, secondly, to the character of change (the point at which performance transforms) – crucially, structural change; to lack of change, and to what comprises desirable, or possible, change. They encompass, thirdly, what determines performance, change, or lack of change: they are about causality.

Clearly, such judgments cannot be simply empirical (I make a plea for the empirical but against empiricism). The need to be ordered by, and rooted in, theory: in the ideal types which theory establishes, and the hypotheses which theory suggests. That is essential. Treatment of the agrarian question is impossible without such theoretical foundations. But analysis, further, must be grounded, as Ben Fine has put it, "in secure theoretical foundations that remain sensitive both to diversity and historical contingency" [Fine 1993:2]. That is crucial.

Comparison is essential. It is, in part, via comparison that one might make the relevant, sensitive judgments about performance (in the context of the agrarian question, or more generally). How might one judge the adequacy of performance without some comparative yardstick? Comparison suggests what is reasonable, and even, necessary. It is, to a degree, in comparative terms that one might conceive of change in a suitably nuanced manner. How, otherwise, might one understand the nature, the scope, and

the likely direction of change? Comparison, moreover, may point to the possibility of a substantive (non-trivial) diversity of outcome. It is in a comparative perspective that one might reach for possible lines of causality. Comparison has the power to widen the range of possible hypotheses. Comparison, can, suitably pursued, prevent analytical closure: by keeping one alive to the diversity and historical contingency insisted upon by Ben Fine. The sensitivity to diversity and historical contingency, I posit, must come, in part, from carefully pursued comparison. This is why I embarked upon my own work on paths of agrarian transition.

The claims made, by both Chenery and Syrquin and by Barrington Moore, are, I suggest, perfectly justified. Comparison can clarify and make more secure the analytical judgments which we make. It can, further, be a fertilising influence. It can open analytical perspectives. It can do so, when securely based theoretically, by extending our range of criteria independent of a particular context, and so allowing theory to be more nuanced in what it can reveal.

An absence of sensitivity to diversity and historical contingency means that analytical channels may be blocked. Comparison has the power to unblock those channels. To recapitulate somewhat, I have found that this it may do in four essential ways. Firstly, it may reveal significant historical regularities. It may identify 'uniform features of development'. That, in itself, can be immensely valuable. Thus, in examining the agrarian question the kind of structural change identified by Simon Kuznets is of significance. Secondly, within those historical regularities, a variety of historical pattern may be demonstrated. That, too, is of great potential value. The detailed examination of differing paths of agrarian transition shows that clearly. Thirdly, it may lead to the questioning of stereotypes, which, I hope, my own work does, in examining the real basis of historical/analytical models taken to treatment of the agrarian question in contemporary situations. Fourthly, it may generate exciting new hypotheses. Abandoning the Eurocentrism to which I have fallen victim, I would here stress the enrichment of the study of European history by hypotheses taken from the rich and powerful literature on the agrarian question in, say, India (let us say, on sharecropping, the inter-sectoral terms of trade, or the inverse relationship to which I have already drawn attention).

But what of the two archetypal variants which I have identified? Are they equally valuable in analysing the agrarian question? They are not. Of the two, the case-oriented approach is more useful, and is the one I have adopted. It is not, however, without its difficulties.

I will make just two points about the variable-oriented approach as a possible major way of approaching the agrarian question. Each relates to complexity, but in a different way.

Firstly, by its very nature, it abstracts from complexity and diversity, in its search for the general. Its strengths are many,¹⁹ and, as I have suggested, it can yield powerful insights. But, if one's aim is to capture complexity, historical contingency and substantive diversity, then it has clear deficiencies. It cuts a swathe through complexity, abhors historical contingency and discounts diversity. It seeks the general at the expense of the particular and the specific. Thus it could not cope with the diversity of outcome characterising the case studies that constitute my examination of paths of agrarian transition: a diversity of class structure, of pattern of the productive forces, and of interrelation between the two. As a major means of investigation, it is not, thus, appropriate to an analysis of the agrarian question of the kind which I am pursuing.

Secondly, there are certain kinds of issue which it simply cannot address. How could one capture the intricacies of class and class relationships thus? The evidence available cannot be manipulated or interrogated in this kind of way. Even if one wished to wield Occam's razor, one cannot via this approach. If you like, it is increasingly at a loss as causal complexity multiplies. That is to say, it would be unable to unravel the causes of the diversity of outcome found in the different cases. For example, if we hypothesise that class conflict is the major determinant of change, and that the outcome of such conflict is crucial to the nature of the path of transition followed, the variable-oriented approach would not enable us to test either of those propositions. What is called for is a careful and sensitive qualitative treatment. Only a case-oriented strategy can allow that.

The case-oriented comparative approach has its own problems. These I cannot pursue in detail. But one that I have encountered is the problem of the nature of the evidence used by the comparativist. Let me concentrate on that, and on my own experience. The comparativist must rely on secondary sources, and must get a satisfactory purchase on these. He, or she, must get it right in this respect. The following problems arise.

The first is that of ensuring that the same questions are asked and the same analytical categories used consistently, across the individual case-studies. There is the problem of the possibly limited nature of the evidence available. One then runs the danger of becoming the prisoner of those who do not ask questions relevant to one's concerns, or of being misled by those who used analytical categories inappropriately. In this instance, for example, one may search in vain for treatment of the nature and diversity of the

landlord class; or, one which I have found especially trying, the course of the inter-sectoral terms of trade. Or, 'peasants' may be defined idiosyncratically; or peasant strata identified carelessly. Great vigilance is called for.

There may, however, secondly, be an abundance of evidence and a diversity of interpretation on particular issues. That, too, is a problem which I have met and struggled with. It is not surprising, then, that the comparativist, plundering as he must the work of specialists, encounters the reservations and suspicion of those specialists not themselves comparativists. Thus, for example, specialist historians may spend their whole life working on a particular country, or region, over a narrow range of time: perhaps to most excellent effect. Thoroughly familiar with their sources and with the literature relating to their period, they may question, and even reject, efforts to make what may seem to them to be unjustified, sweeping generalisations (although, from the viewpoint of the variable-oriented approach, they may be far from sweeping). As Eric Hobsbawm observed in his review of Perry Anderson's two volumes [Anderson 1974a and 1974b], professional historians are

increasingly shackled by the double fetters of primary research and specialised knowledge. Like animals outside their own territory, historians feel neither confident nor secure once they leave the shelter of 'my period' [Hobsbawm 1975b:177].

These feelings will, of course, be aroused by the comparativist, and they may translate into hostility when the comparative historian gets on to their individual territory, even if there is recognition of the possible value of comparative history outside of that territory.

I recall, in the 1960s, when Barrington Moore's book was being reviewed, the observation more than once that it was a remarkable piece of work displaying immense historical/sociological imagination and so on, except that it got country x wrong - country x being the country on which the reviewer was a specialist. But there is a genuine predicament for the comparativist. We do have a real problem here. The comparativist must get it right.

That problem relates, in part, to the kind of evidence used by the comparativist, and whether it is representative; how, from a perhaps vast sea of evidence, the comparativist chooses; what the comparativist does with counter-evidence. Given an inevitable need to be selective, one wonders what working principles exist, or might be established, for comparativists, in this respect. Perhaps there are none, other than the exercise of mature judgment. One may mention an outstanding comparative historian, Robert Brenner. One notes Heide Wunder's waspish and dismissive comment on Brenner, and on

comparative historians in general:

It is the lot of the comparative historian to have to rely on textbooks and secondary literature, but unfortunately Brenner has fallen victim to the Prussian myth (Hohenzollernlegende) with all its contradictions and inconsistencies [Wunder 1985: 91].

I think that this is unfair on Brenner. But how, then, does the comparative historian cope with this problem? To which particular textbooks and secondary literature does he or she resort? Above all else, I think, he or she must exercise the most scrupulous care in treating those secondary sources with respect. The best comparativists - Marc Bloch, Barrington Moore, Theda Skocpol, Perry Anderson, Robert Brenner, and many others - do, and their work is exciting, illuminating and often seminal.

It is a problem which demands immense vigilance on the part of the comparativist. It also requires certain qualities. The comparativist, having displayed, perhaps, the necessary 'foolhardiness' in confronting large themes, and having chosen to do so via a case-oriented approach, requires, as Hobsbawm has it, "an enormous appetite for reading" and a "notable capacity for synthesis" [Hobsbawm 1975b: 177 and 178]. The comparativist, then, may be doubly foolhardy, in not only addressing large themes, but in risking judgment according to such standards. Yet, the potential analytical rewards are great. As a way of investigating the agrarian question, via a comparative, historical political economy, it has much to offer.

V

Conclusion

I noted, at the beginning the premature announcement of the death of political economy. When the American Economic Association held a Centenary Appreciation of the publication of *Das Kapital*, Paul Samuelson, after a swinging attack on Marx, concluded as follows:

But this is a birthday party and I approach the boundaries of good taste. Let me conclude by wishing that, like Tom Sawyer attending his own funeral, Karl Marx, could be present at his own centennial. When 'the Moor' rose to speak, how we would all pay for our presumptuousness! [Samuelson 1966:623].

Indeed. And how they would pay for false notices of the death of political economy.

Notes

[This paper comprises the text, with minor amendments, of the author's Inaugural Lecture as Professor of Political Economy at the University of London on October 27, 1994.]

1 It is invidious, not to say tiresome, to list names. We may say, however, that economists

like Arthur Lewis and Rosenstein-Rodan, two of the founding fathers of post-second world war development economics, are clearly in the broad, non-Marxist classical tradition. It includes, too, the remarkable Piero Sraffa (who did, however, have broad Marxist sympathies), Krishna Bharadwaj and a whole school of post-Ricardians (including such as Ian Steedman). Among the Marxists, one might mention Maurice Dobb, Ronald Meek, Paul Baran, Paul Sweezy, and more recently Amit Bhaduri, Utsa Patnaik and Prabhat Patnaik; to mention a galaxy of historians, like Rodney Hilton, Christopher Hill, E P Thompson, Eric Hobsbawm, Perry Anderson, Robert Brenner. The list is far from being exhaustive.

2 It includes economists like James Buchanan and Douglas North, and in the field of development Anne Krueger, Jagdish Bhagwati and T N Srinivasan. For a brief treatment see Caporaso and Levine (1993: 79-99).

3 *The Guardian*, October 15, 1994. The piece was by Martin Walker. Hobsbawm's latest book is *The Age of Extremes — The Short 20th Century, 1914-1991* [Hobsbawm 1994], the final in a remarkable series on the capitalist era from the 18th century to the present [Hobsbawm 1962, 1975a, 1987].

4 We are told that: 'The last Marxist sits high above New York, an open window bringing the honking of cabs from Union Square 11 floors below. He is sipping malt whisky...'

5 Those familiar with Lewis's writing will recall the opening words of his celebrated essay 'Economic Development with Unlimited Supplies of Labour':

This essay is written in the classical tradition, making the classical assumption, and asking the classical question. The classics, from Smith to Marx, all assumed or argued, that an unlimited supply of labour was available at subsistence wages. They then enquired how production grows through time. They found the answer in capital accumulation, which they explained in terms of their analysis of the distribution of income. Classical systems thus determined simultaneously income distribution and economic growth, with the relative prices of commodities as a minor by-product [Lewis 1958:400].

A more succinct, elegant and direct statement would be difficult to imagine.

6 This is from one of the three lectures which Dobb delivered at the Institute of Statistics of University of Bologna in 1962. These lectures were entitled 'Some Problems in the History of Capitalism', and the one from which I have quoted had the title 'Prelude to the Industrial Revolution'.

7 This is from Dobb's powerful chapter on David Ricardo, which, he tells us (see his Note of Acknowledgement at the beginning of the book), was heavily influenced by Piero Sraffa's work.

8 This may sound curious as part of a tradition that includes Adam Smith. I am not, of course, claiming his authority for policies of concerted state action. That would be

absurd. It would sit ill with his consistent attack on the Mercantilist state, his belief in the power of the 'invisible hand' and so on. But what I am suggesting is that Smith was acutely aware of the historically specific nature of his analysis, in a way in which his latter-day disciples are clearly not. Cf. Parker (1982: 25-26) and Bharadwaj (1989: 20-21).

9 What follows is a most brief treatment of the agrarian question. I deal with it at far greater length, and in a more nuanced way, in Byres (1986a, 1991, and forthcoming).

10 He was then spending a year's leave in Oxford, from the Agricultural Economics Research Centre of the University of Delhi, where he was, at that time, Director.

11 For a most useful survey of the debate up to 1982 see Thorner (1982) and for an excellent collection of contributions to the debate from the *Economic and Political Weekly*, Patnaik (1990). The debate did not, however, take place exclusively in the pages of the *Economic and Political Weekly*. See Byres (1992), where [Patnaik 1990] is reviewed.

12 In the *Wealth of Nations*, for example. See Smith (1976: 141-42, Book I, ch X, 'Of Wages and Profit in the Different Employments of Labour and Stock'; 376-77, Book III, ch 1, 'Of the Natural Progress of Opulence'; and 188, 284). See Meek (1962: 353; 1973: 290-91).

13 Ricardo provides a treatment of what we would now call the terms of trade problem.

14 As Bloch himself tells us, he had several predecessors, including Henri Pirenne (whose influence on him was great) and the linguist, A. Meillet. He was especially interested in, and impressed by, the use of the comparative method in comparative linguistics. Scrutiny of this, he argued, had much to offer the historian [Bloch 1967: 45, 67-68, 76]. See also his biographer [Fink 1989: 106, 117-19].

15 See, for example, Bloch (1967), Ragin (1987), Sewell (1967) and Skocpol and Somers (1980).

16 While Barrington Moore's book is clearly a classic, and a work of some power, it is not without serious blemish. Thus, for example, the ignoring of colonialism and imperialism, in a work on the early industrialisers in Europe, and, of course on Japan, and on an ex-colony and a former semi-colony, India and China, represents a significant shortcoming. But this, we must stress, is not a defect of the comparative method *per se*. It is, rather, a weakness in the manner of its pursuit.

17 His cases are England, France, America, China, Japan and India.

18 There are now many notable instances of the case-oriented approach. One notes, in different traditions but using the case-study approach in broadly similar fashion, for example: Eric Wolf's *Peasant Wars of the Twentieth Century* [Wolf 1969] (six case-studies); Perry Anderson's outstanding *Lineages of the Absolutist State* [Anderson 1974b] (ten cases); Theda Skocpol's *States and Social Revolutions* [Skocpol 1979] (three cases); Clive Trebilcock's *The*

Industrialisation of the Continental Powers, 1780-1814 [Trebilcock 1981] (three separate cases and three taken together); Colin Mooers's *The Making of Bourgeois Europe* [Mooers 1991] (three cases). There are several variants of the approach. Peter Kolchin, for example, takes two cases, in his *Unfree Labour American Slavery and Russian Serfdom* [Kolchin 1987]. He does not follow the Barrington Moore procedure of separate case studies. Rather, he takes his cases together and develops the comparative argument as he proceeds. He tells us that "at the simplest level the comparative approach reduces the parochialism inherent in single-case studies by showing developments to be significant that would otherwise not appear to be so" (p ix). Another example of a 'running comparison' — a straight comparison from start to finish — is Patrick O'Brien and Caglar Keyder's, *Economic Growth in Britain and France, 1780-1914* [O'Brien and Keyder 1978]. Two cases are chosen and they are compared, as far as possible, indicator by indicator, before conclusions are drawn. The study by Byres and Nolan, *Inequality: China and India Compared, 1950-1970* [Byres and Nolan 1976] is a further example of such a comparison. Robert Brenner's immensely stimulating writing on agrarian class structure and economic development in pre-industrial Europe is an important illustration of the comparative method [Brenner 1976, 1985]. This differs from the examples of the case-oriented approach already cited. A particular argument is made, and runs through the whole presentation. He does not present discrete and separate case-studies, to provide the basis for an eventual set of conclusions and generalisations. Rather, the argument is presented at some length, and then illustrated by a reading of the evidence of a limited number of cases, back-to-back, so to speak: now England, now France, now Germany; or now eastern Europe and now western Europe; and so on. E L Jones, in two works of comparative history that have attracted much attention, is different again [Jones 1981, 1988]. He develops a wide-ranging argument, drawing examples from a bewildering variety of time and place, now and then focusing on a case-study that catches his attention.

19 These strengths are identified and discussed in Ragin (1987: 53-68). They are obvious enough. I will not repeat them here.

Development Priorities

Practical Issues of Methodology and Modelling

Kalyan Raipuria

In arriving at the total outlay for the Five-Year Plans, the sectorwise allocations and priorities for the plan-period broadly follow a macro-model. But we do not have a model for annual plan exercises and the prioritisation to be followed, though the sectoral allocation of resources by the planning system amounting to more than a hundred thousand crore rupees annually profoundly affects the future of the economy and the people. This paper looks at annual forecasting models outside the planning system and seeks to indicate some specifics of research and action required for development of annual plan modelling.

IN reaching the total outlay of the Eighth Five-Year Plan (FYP) of Rs 8,71,100 crore, at 1991-92 prices, the sectorwise allocations and priorities for the Plan period, 1992-97, broadly followed the macro-model,¹ results being consistent with the projected overall growth rate, the contribution of the various sectors in growth, and the estimated ICORs for the selected sectors. The much more detailed sectorwise and centre-statewise public sector allocations were based on micro-level projections and negotiations but in line with the above results.

But, for annual Plan exercises, at current prices we do not have a model and detailed exercises, towards prioritisation to be followed, once the FYP is finalised, which is at base year's prices. There exist at least three major annual forecasting models of NCAER,² IEG-DSE,³ and RBI,⁴ outside the planning system, aimed primarily to bring out the economic outlook on annual basis and/or simulate certain policy objectives like containing budgetary and fiscal deficit, change in administered prices, and export-import variations. The CMIE forecasts are quoted by *The Economist*, London, regularly as part of 24 emerging market economies' indicators. However, we have not come across any model on the basis of which forecasts are issued, comprehensive database notwithstanding. The issue is whether some of these and the FYP models are mutually exclusive and amenable to interplay.

PRESENT SYSTEM

Given the consistent distribution of resources between the centre and the states, according to major heads of development and ministrywise projections, for five years, the annual exercise undertaken by the Planning Commission in terms of sectoral allocation corresponding to the assessed availability of financial resources leaves much to be desired. The task in hand, therefore is to optimise (aside from consistency) results for Annual Plans and examine if modelling can help in this, covering the private (notably, corporate)

sector by way of providing guide-posts to the market. Guidelines provided on inter-sectoral distribution fall too short of the requirements.

The plan size which is determined according to the own resources of all the states, including the states' share in central taxes, estimates of utilisation of external aid, i.e. externally-aided projects, (EAPs) and central support (within the control totals) indeed calls for choices on sectoral details which should emerge from a macro-model, keeping in view crucial magnitudes and direction of the state FYPs. However, no such effort for any state is presently made at the centre or by any state due to lack of model usage and acceptance in regard to the derivation of annual plan, in both financial and physical terms, from the corresponding Five-Year Plan aggregates.⁵

In determining the sector/ministrywise levels of Plan outlays at the centre, which include Plan investment by central public sector enterprises (CPEs) for the Annual Plans, the reference point would indeed be the Eighth Plan (at 1991-92 prices) and the size that had been built in the Annual Plans (at current prices).

But determination of the annual Plan size and the allocations should not be mere extrapolations of growth over the past years, but should be guided by the resources in sight with due regard to the possibility of changes affecting sources also broadly furthering Plan prioritisation.

Thus, the total central budgetary support should be in conformity with the need for limiting the fiscal deficit. Given the control total, the budgetary support to some of the sectors/ministries may have to be scaled down, while in some cases the level may have to be protected. The pattern of budgetary support thus projected for the various sectors/ministries would have to reflect the Plan priorities indicated in the Eighth Plan unless significant change is required based on the mid-term review and/or replanning exercises.⁶

To determine the investment of the CPEs comprising 70-75 per cent of the central sector Plan outlay, the feasibility of IEBR

and the possible modes of economically rational additional resource mobilisation (ARM) need to be systematically looked into. The ARM need to be finalised in net terms, net of the cost escalations in sight. Indeed, mobilisation is also a function of policy plans and investment levels, including new projects/expansion of the existing capacities, as investments depend on growth and levels of incomes albeit time-lag. Ideally, these may be endogenised through structural relations part of a macro-model, providing price adjustments. The model based on structural relations need to cover depreciation related to capital and retained profits related to normative rates of return. ARM requirements could then be derived and the feasibility of realising the projected ARM ascertained. Sectoral capital-coefficient matrix may be used in determination of investment band replacing unique figures.

The estimates in respect of bonds/debentures of central public sector enterprises need to be determined in the light of the projected overall market borrowings of the centre and the central public enterprises for the Eighth Plan, which may hold good after the reduction in the SLR as may be targeted on incremental or average basis. Tax-free bonds at 9 or 10.5 per cent interest rate need to be phased out in view of the high final or effective interest rate and lack of real market for them, originally evolved to tap rural savings. The levels have been squeezed already in view of their distortionary effect as also difficulties in mobilisation in the changed conditions. Considerable increase in bonds may be projected for selected core infrastructure sectors whose outlays will be increasing but budgetary support may not keep pace with them. This should of course be subject to prudential limits determined by repayment liabilities in regard to bond redemption and their impact on IR.

As for the resources in terms of ECBs and suppliers' credit, according to sectors or ministries, the possibilities need to be analysed in the light of emerging international environment, feasible level of inflows judged in terms of debt service and perspective of international capital markets.

MONETARY ENVIRONMENT

Among the national level planning and policy models, the formal one used as an aid to projections of Five-Year Plan targets with macro-economic magnitudes and to formulation of the country's long-term (15 years) perspective is the one published in the context of the Sixth and the Seventh Plan.⁷ The model consists of a core model and seven sub-models in respect of (i) agriculture, (ii) forestry, (iii) industry, (iv) consumption, (v) exports and imports, (vi) financial resources, and (vii) demography and employment generation. The core model consists of an interdependent macro-economic model (MEM), an input-output model (IOM) and an investment model (IVM). The MEM involves usual national output and expenditure identities, and this in co-ordination with IOM of 50 sectors (compressed from 115 sectors), determines investment in the terminal year of a plan endogenously.

Given the target growth rate and base year GDP, saving and consumption of the public and the private sector and certain other exogenous variables, the MEM determines allocations for investment in major 11 sectors.

But the relations mostly being arithmetic, are amenable to adjustment of change in figures needed due to iteration or their availability at different points of time period of running the model.

The crucial financial sector sub-model has: (i) the public sector, (ii) the private sector separated between the corporate and the non-corporate, and (iii) the rest of the economy (ROE). The relation between the scale and the composition of the household sector saving, disposable income and inflation is considered. There may be elaborate modelling for the public sector savings, separated into budgetary savings and surplus from public enterprises and

may cover operation of the capital market and detailed flow of funds between financial institutions and other sectors. Such wealth of information and estimates from the model have their source in RBI, which publishes the seven sector flow-of-funds data⁸ on much reduced time lag in recent years. The model, however, covered flow-of-funds only from major sectors, viz. public, private and corporate and household, aside from the rest of the world (external) sector. The description of the sub-model, in the *Technical Note* (1986), clearly indicates, short of a real formal financial model, the kind of regression equations considered, relating to currency, bank deposits, provident funds, private corporate and co-operative shares, securities of term-lending institutions, and different assets. For example, bank deposits are regressed to GDP and GDP deflator, while shares are a function of the factors:

GDP at market price deflator;
Shares of non-agricultural income in national income;

Ratio of current year's to the previous year's prices;

Growth pattern of shares and debentures (dummy);

Lagged (by one year) shares; and
GDP at constant market prices.

In such an exercise, when practical judgment is applied at every point in determining the period of analysis, the parameters and more importantly *what finally determines what*, without annual phasing and as also state-level disaggregation, the results remain idealistic/academic particularly as little attention is given to the clearing mechanisms, factor prices, and output/input prices.

Interest rate, for example, appears nowhere in the financial resources model, nor the fiscal (especially the overall tax rate) and monetary policy variables (viz. SLR and

CRR, minimum/maximum lending and deposit interest rate, and share of priority lending in total). Draft of the government and private corporate sector on household financial savings by instruments (viz. currency, deposits, contractual savings, and corporate shares) is projected to the overall extent of over 95 per cent, but its effect on growth and savings/investment is not considered and any change in policies needed becomes out of question.

It is in view of the above operational problems of planning and certain methodological issues raised by serious researchers, published earlier and also recently in *Economic and Political Weekly* (Bombay) and elsewhere, that one looks for annual forecasting models/systems which can take into account the latest trends and can complement the present annual planning system in the context of the Five-Year Plan.

NCAER MODEL

Among the available annual forecasting models, that of the NCAER⁹ is well formalised, documented, and regularly operated for counter-factual analysis and forecasting GDP; growth of money and prices; external trade and payments; growth of industry, infrastructure, and agriculture; and investments. The model is also used for policy analysis in respect of money and price variations in tax rate; expenditure switching notably in subsidies; and growth of exports and imports.

The economy is represented by eight production (goods and services) sectors and four agents; government; non-agricultural wage income earners; non-agricultural profit (non-wage) income earners; and agricultural income earners. The model is built around the consistency framework of a Social Accounting Matrix

TABLE 1: SUMMARY OF NCAER FORECASTS AND ACTUALS OF MAJOR-LEVEL VARIABLES, 1992-95
(Percentage change over the previous year)

Variables	1992-93		Actual	1993-94		Actual	1994-95

(SAM). The model assumes excess capacity in non-agricultural sectors and, postulates that supply adjusts to demand thus branding the model as demand-based. The model (a' la Kalecki) determines prices in these sectors applying variable mark-up rates on prime costs. The agricultural output and prices are exogenously determined from an agricultural sub-model.

The 77 equations are operated under nine blocks, viz:

Price-wage block;
Output block;
Income block (covering income classes);
Savings consumption block;
Investment block;
Government block;
Balance of payments determination;
Accounting identities (national accounts);
and Monetary block.

The basic equations of the output block cover the output of intermediate inputs, output for private consumption, output for government consumption, increase in savings, investment, exports and imports. Imports are endogenous. The commodity balance equations are included in the input-output framework. GDP, at current market prices, is the sum of all the final demand elements less imports. The price-wage equations are based on quantity-price relations.

An interesting equation in the price-wage block determines prices, and considers material input prices, wages and import cost. This block shows how these costs can be endogenised.

The merit of the above model lies in its structural nature and number of behavioural (with clearing mechanisms) equations. The parameters are estimated on the basis of time series or cross-section data using regression analysis. The model is solved using the system of Gauss-Siedel interaction routine, also used for the planning model. Another noteworthy feature is the scenario analysis developed on the basis of different assumptions regarding the exogenous variables. Prices are responsive to the specified determining factors. Thus, it has direct relevance to the policy processes. The model gives an explicit relationship between money supply, GDP and prices of so much of common interest to macro-management experts, media, and public at large.

The difficulties with the above model primarily relate, for application in planning, to limited sectoral disaggregation and certain exogenous variables, viz, government investment which is a kind of instrument variable insofar as sectoral allocations speak volumes for government's current policies and a planner would like to see the implications of the alternatives. In the present environment, variables like competitive imports also need to be endogenised.

Table 1 presents a summary of NCAER model forecasts, made twice in a year, for the three-year period 1992-95. The forecasts for 1992-94 are compared with the actuals/official estimates. Statistical analysis of the observed deviations is a matter of a separate exercise.

IEG-DSE Model System

The other short-term modelling system is that of Institute of Economic Growth (IEG) by K Krishnamurthy *et al*¹⁰ and Delhi School of Economics (DSE) by V Pandit.¹¹ The system is an ongoing developing macro-modelling project. Its results (latest 1993) are biannually presented in project Link meetings, and published in popular Indian economic/financial dailies.

According to the main authors, the system is quasi-econometric to the extent judgment is applied at every step. A comparative study of the two models shows that neither of the two models was meant, in their present form, to be a forecasting model; they were aimed to study the issues of rate, structure, and sources of growth. The form itself is changing and each of them covers certain aspects of the economy left out by the other. Thus, these two models are being operated in a system as complements. The two models have a number of similarities, though different not only in size and the sample period, but in approaches notably in dealing with price behaviour.

Both models have agriculture sector divided into food and non-food crops, and cultivated area for the two kinds of crops is visualised to respond to relative prices; both consider the growth-inflation trade-off implied by the challenge of further mobilisation of resources (FMR), and both focus on deficit financing of public sector investment, and the budget constraint.

E = Estimated (based on partial information), INF = Infrastructure, F = Forecast, SV = Services, P = Provisional, PA = Public Administration, QE = Quick Estimate (CSO), AE = Advanced Estimate (CSO).

Approaches, however, differ. The first (IEG-KK) explains change in agricultural output via productivity, while the other (DSE-VP) explains in terms of factors such as cultivated area, rainfall and irrigation. In respect of price behaviour, the first explains absolute price levels, whereas the equations relating to prices in the second are specified in terms of the annual rates of change in all the relevant variables. The KK model consists of 77 while VP model of 60 equations and the sample period in the former relates to 1950-78, while in the latter to 1960-80.

In KK, output of the tertiary sector is demand-determined and the manufacturing sector is supply-determined by means of production functions, aimed to highlight lagged effects of capital formation.

In VP, even though non-agricultural output as a whole is demand determined, it is highly constrained by several exogenous and endogenous factors and the multiplier mechanism cannot be relied upon for raising output. Output of services is determined by levels of activity in the agricultural and the manufacturing sectors.

A notable feature of the KK model is the scope for analysis of the links between public and private investment decisions and the complementarity and crowding-out effects of public investment.

In KK, the volume and allocation of investment in the public sector is considered to affect output through current demand as well as potential supply. In VP, revenue and expenditure take into account the effect of price level variations, and policy decisions are transmitted to the monetary variables, as also to saving, investment, and output. Monetary sector is dealt with in VP in more detail than in KK. The external trade is exogenous in KK; while in VP non-food imports, exports and export prices are treated endogenously.

There are also differences in specifications of variables and functional forms of relationships. In their (KK-VP) own assessment:

By virtue of its emphasis on (i) the capacity-creating effect of investment on potential supply, (ii) the role assigned to infrastructure, (iii) productivity changes in the economy, and (iv) the secular relationship between money, prices and output, KK is more suitable than VP for studying the pattern and tempo of growth and other long-run movements in the economy. On the other hand, its treatment of (i) the saving-investment equilibrium, (ii) monetary and fiscal policy issues, (iii) causes and consequences of inflation, and (iv) impulses arising from the external sector in an open economy, renders VP more appropriate for policy analysis of the short- and medium-term problems.¹²

KK Model¹³ consists of equations which include clear-cut four sectors of national

accounting. VP model¹⁴ consists of fewer equations and agriculture gets focus, aside from macro-economic aspect.

The notable feature of the KK model is its treatment of the public sector and importance of the infrastructure in the growth process. For example, the following model result is directly relevant to the basic objective of the present paper, i.e. to develop ability to model for the annual plan allocations in public sector:

Public sector investment acts as an engine of growth. It augments output in all the sectors. It has a complementarity effect on

private investment in agriculture and both complementarity and crowding out effects in industry. Public sector infrastructure improves productivity in industry and in tertiary sectors.¹⁵

In VP, private investment is treated in some details of interest in the present context of its increasing share even in the infrastructure sector. Investment is disaggregated between household and corporate sectors. Saving behaviour of household is treated as a function of disposable income, lagged inflation and ratio of output of agriculture to the non-

ANNEXURE I: COMPARISON OF SELECT THREE MODELS

Feature	Long- and Medium-Term	Short-Term

(12) Usage in government	Five-Year Plan	Ministry of finance review of the economy	Part of project Link
(13) Relevance to economic reforms	Reduction in government dissavings considered	Increment in trade, globalisation and exchange rate considered	Reduction in share of public sector and its effects considered
(14) Price clearing mechanism, if endogenous	No	Yes	Yes
(15) Relevance to federal policy issues	Break-up of magnitudes between centre and states attempted at broad levels of magnitudes	Nil	Nil

Notes: * Project commissioned by the Ministry of Finance (Department of Economic Affairs, Economic Division).

** Where, n stands for sectors mostly corresponding to IOM, i.e. compressed from 225 to 89 sectors. There are 14 in case of relatively aggregative exercises, viz. investment model; total number works out to 2,242, under 9 blocks.

*** Aid, exports, price index of exports and imports, population, index of rainfall, government expenditure, and public sector investment.

**** As explained by Montias,¹⁶ in a Gauss-Siedel iterative procedure, each industry's gross output is calculated by adding its (pre-determined) net output and the material requirements on the part of other sectors, these requirements being computed on the basis of last-obtained estimates of the consuming sectors' gross output. If the matrix can be perfectly triangularised (the order of ranks and columns so arranged that only zero appear above the diagonal), a consistent set of gross outputs can be ground out in a single iteration.

agriculture sector. Corporate savings are taken exogenous and split into its fixed and inventory components. Household investment is explained by rates of interest and inflation. Corporate investment in terms of fixed capital formation is explained by changes in the level of non-agricultural output as a proxy for the expected change in demand, the lagged rates of profit, and lagged investment. Inventory investment is related to the level of output and the real cost of holding stocks.

The system of KK-VP models has constantly been in the process of growth. The exact state-of-the-art is not known as consolidated documented version is not available in print. The major problem has been how to update parameters of a medium-term model when every year the system is asked to make forecasts.

An evaluation reveals that both the models remain weak in treating the issues of energy sector, transport modes, and the social services. In the context of adjustment, the prioritisation of the social sector is gaining significance. It may, however, remain difficult to model this sector except analysing the effect of increased public expenditure on this sector.

A more directly relevant modelling exercise, in the present context, aiming a resource mobilisation and allocation, with emphasis on supply side, and focus on variations in 'celebrated ratios' of economics such as output-capital ratios, rates of saving and investment, share of public-private sectors, and import intensity, is reported in Krishnamurthy et al.¹⁶

Table 2 presents the summary of IEG-DSE model/system forecasts made for recent period covering 1992-95, compared with the actuals/official estimates. Variations among the first forecasts and actuals, particularly notable in external sector, point to the required strengthening of information as well as estimation basis. A statistical exercise analysing systematic error and 'bias' in the forecasts will be reported separately.

LIMITATIONS AND POSSIBILITIES

No single model can meet the increased requirements of policy formulation and planning in the changing domestic and outside conditions. Computable general equilibrium (CEG) models indeed have their limitations. Long- and medium-term models cannot be applied for quick short-term estimates. Economywide models can adopt regional disaggregation to a limited extent. Similarly, macro-econometric models can capture sectoral trends only to an extent in terms of number of sectors and in terms of capturing human behaviour and technology.

What is true is also that some models are readily acceptable as they are based on

judgments, rules of thumb, and are non-mechanical in results, while some are highly sophisticated but unacceptable on account of 'outliers' they may show, as results, at least from the short-term point of view.

Due to the above difficulties, it is worth considering if we can identify a few accessible models which show possibilities of interplay and help us to maximise comparative advantage of these, i.e. if they may complement and supplement each other, in respect not only of parametric estimates, but also of economic approach and policy simulations by way of cross-checking the forecasts of mega variables.

Such interplay is greatly facilitated if there is consistency in sectoral disaggregation and data base (source and period) and harmonisation in parametric estimation.

A concrete case is an interplay between a pure macro-econometric model with models of a few sectors corresponding to broad GDP classification of agriculture, manufacturing and services, and a model which provides in-depth analysis of agriculture sector alone with largest share of material GDP and more so of employment.

To what extent interplay between the Planning Commission medium-term model and one of the short-term models reviewed in the present paper is possible would depend on the commonality of the objective and required research and action discussed later. The comparative features of these models are brought out in Annexure I. Their sectoral disaggregation is shown at Annexure II, which aside from data base would need to be harmonised as a prerequisite of interplay.

Certain areas of interplay, which we think could be part of agenda for research, action, and development (RAD) include inputting

agriculture-industry linkages,¹⁷ prices, foreign trade and different financial flows, technology choices, and exchange rate determination, relative roles of public-private sector and state level disaggregation notwithstanding. The final exogeneity can be minimised through interplay as presently there are a large number of exogenous variables in the individual models, and their exact feasibility can be discussed among the partner modellers.

INTERPLAY WITH A GLOBAL MODEL

To strengthen the external sector simulations and bring out the implications of the emerging trends in the world economy, as also the developments which may be taking place in the domestic economy for liberalisation and globalisation, networking with select global forecasting models would be in order.

The relatively well known short-term global forecasting organisations/model builders are those of Economic Intelligence Unit (EIU), Golden Sachs, Merrill Lynch, J P Morgan, Morgan Stanley, Nomura, Salmon Brothers and the Cambridge Economic Policy Group. Their forecasts are synthesised regularly by *The Economist*, London, covering GNP, prices and current account. However, models of Project Link, OECD and the multilateral organisations may have comparative advantage especially of policy interactions leading to empirically more useful forecasts. Our close association with the select organisations may enable us to get detailed forecasts on prospects of the world economy in general and the advanced economies in particular. As a next step, attention be paid to develop the interplay with the forecasting models of the select organisations.

For networking with the short-term global modelling systems, one in sight to consider

AN AGENDA FOR RESEARCH, ACTION AND DEVELOPMENT (RAD)

In this section, an opportunity is taken to think aloud, aside from indicating some specifics of research and action required for development of annual Plan modelling. One instance is to consider many 'as-if' scenarios before a unique estimate of resources and allocation is finalised, to bring out policy implications in the context of Plan priorities. For example, the scenarios, e.g., in allocations for energy may include large projects to be taken up jointly with the neighbouring countries (such as Karnali in hydro-power sector with Nepal and gas-based with Bangladesh). Resource mobilisation may include a number of innovative schemes to bring informal and black economy into the resource-net and schemes to mobilise project-specific NRIs funds and Euro-money by the states.

Thinking aloud would also mean that the modelling-system includes private sector resource mobilisation and allocation analyses. Sectorwise data-base needs to be built-up, now easy for private organised sector after capital market has taken-off in a significant way and several orgwares and softwares have been developed outside the government (such as Prime Data Base). Considerable quantitative and futuristic research on unorganised sector, however, need to be done.

As for modelling, one had an unhappy thought after review: with so much work done every five years, and then every year, by central as well as state-level experts and administrators on resource mobilisation and allocation of projected resources, why have we not done well on intra-central governmental and centre-state planning relations which are conducive to appropriate prioritisation, faster growth and balanced development of the country. Have we not ignored, for long, each other's good advice and worked rather at cross purposes. With lot of research being done and given further capabilities as also the necessary hardware (super computer facilities) and software personnel such as the National Informatics Centre (NIC), is it not possible and has not the time come to take stock of the best available anywhere to input for the national cause of planning for long-, medium- and short-term development. The agenda should include what can be done now as also location of the best of the state-of-the-art available in the field of development and policy planning.

Indeed, sectoral allocation of resources by the planning system amounting to more than rupees hundred thousand crores annually is one such cause affecting the future of the millions of the people. While ministry or sectorwise, public enterprisewise and statewise specific allocations of outlays/investments and corresponding budgetary support to be given may still have to be worked out by way of discussions and application of judgment, the modelling system may provide broad guidelines, which help maximise economic returns and social benefits.

In what follows, specifics of the agenda for required research and action are brought out:

(1) Data Base:

- Concurrent updating of basic data-base with consistency in concepts, e.g., use of CSO comparable statewide SDP (gross/net) data consistent with all India GDP estimates.
- Data build-up and construction of surrogate indices to bridge select crucial gaps when actuals are likely to be quite late by two-three years.
- Common classification of industry and foreign trade on the one hand and customs and excise on the other, all to intermesh with the input-output table.
- Technology (present and alternative) information and project assessment.
- Build-up of data base on capital cost and financial norms, sector and statewise, corresponding to DFIs sanctions and disbursements.
- Transformation of present revenue/capital expenditure corresponding to grants/loans to be changed according to economic and functional classification not only at central but also at the state level.

(2) Parametric Estimation:

- Estimation of economywide public and private sector production and investment coefficients.
- Behavioural functions for estimating price response parameters in respect of commodities, factors of production (capital and labour), and foreign trade.
- Input-output and capital coefficient matrices towards updating and using the latest sectoral data base.
- Interaction with RBI for updating of monetary parameters.
- Undertaking estimation of major states' production, consumption and investment parameters.

(3) Analytical Research:

- Endogenising internal resource mobilisation in public sector resource allocation and private sector investment functions.
- Programming model-building for allocation optimisation.
- Interplay of the available short-term models with medium-term models, and of national with global models.

- State-level forecasting and modelling.
- (4) Action and Development:
 - In-house building-up of a Group of macro-level and sectoral experts.
 - Networking of national and outside researchers on specific aspects; and
 - Networking with researchers working on global models to increase capabilities of simulating the external trade, services, and financial inflows.

CONCLUDING REMARKS

The RAD agenda is best concluded in terms of the observation made by Klein:¹⁴

From my perspective, India appears to be in need of a serious 'model-building effort drawing on the best econometric talent, and designed to function as an *ongoing effort*, over many years, turning out rolling forecasts every month or two on the most refined time period possible – probably annually at the present time. Such a project should have the form and appearance of the best effort in western industrial countries, and I hope that in this academic enclave such a research effort will be launched. (Emphasis added.)

The effort was indeed launched reflected in IEG-DSE model, but as we see, we have still 'miles to go' before we compete with the best in the world.

INSTITUTE OF DEVELOPMENT STUDIES

Jaipur

Requires three Senior Faculty at the level of Senior Fellow (equivalent to University Professor) or Fellow (equivalent to University Reader). Social scientists having specialization in Development Policies, Rural Development, Gender Studies, Education and Development and Econometric Modeling will be given preference. Other scholars with proven academic and publication record and research experience in any relevant area of development studies may also apply. Applications giving full details of the academic qualifications, publication record, work experience, and other relevant information should reach the undersigned within three weeks of the publication of this notice. The candidate should give names of three referees to support his/her candidature. Applicant should clearly indicate whether he/she is to be considered for the position of a Senior Fellow or a Fellow. Incomplete or delayed applications will not be considered. Those who have applied in response to an earlier advertisement issued by the Institute need not apply again.

Prof. V.S. Vyas

Director

Institute of Development Studies

Jaipur 302 004.

Televisions, Maharashtrian Social Reform and Literary Imagination

Bombay Doordarshan's *Paulakhuna*

Anupama Rao

History, 'realist' novels and Doordarshan collude in the claim to representing a particular brand of the real Maharashtrian woman in the tele serial Paulakhuna. This reality helps and hinders the feminine subject. If the claims of historical change are taken seriously, they could be seen to provide a space for the contestation and struggles of women. At the same time, the constraints of form render the serial incapable of 'seeing' women except through the lens of suffering, sacrifice and struggle within the confines of a family narrative.

THIS article is about a 'tele-event'. The first week of September 1993 saw extensive coverage in Marathi newspapers¹ of Bombay Doordarshan's upcoming broadcast of a 13-part Marathi serial, *Paulakhuna* (i.e. footprint), based on a series of six Marathi novels and a short story published during the period 1890-1950.² That the publishing house Popular Prakashan³ had underwritten the venture, in turn directed by prominent stage, screen, and TV personality Amol Palekar, only added to the sense of 'quality programming' heralded by the print media. In a press release of September 7, 1993, Ramdas Bhatkal (who along with his son Harsha Bhatkal co-produced the serial) introduced the serial as an attempt to portray "...the evolution of Maharashtrian womanhood as depicted in the literary writing from the 19th through the 20th century" (emphasis mine). The novels themselves – Hari Narayan Apte's *Pan Lakshat Kon Ghetu* (But Who Takes Notice, 1893), B V Varerkar's *Vidhwakumari* (The Widowed Virgin, 1928), Narayan Hari Apte's *Na Patnari Gost* (An Unacceptable Incident, 1923), Vaman Malhar Joshi's *Susheelecha Dev* (Susheela's God, 1930), Sridhar Venkatesh Ketkar's *Brahmankanya* (An Unmarried Brahmin Girl, 1930), Vibhavari Shirurkar's *Shabari* (1953), and Arvind Gokhale's *Manjula* (1950) – are landmarks in Marathi literary history. They are what I would describe as the enactment, on the literary topos, of the (problematic) desires embedded in social reform as a historic moment.

Sudha Kulkarni, who did the research for the serial, talked about the importance of these novels thus: "Because of these novels a questioning spirit was created in society; through these novels a thoughtful attempt at social reform was made; and these novels clearly reflect the progressive thinking of their writers.⁴ Let us provisionally accept that social reform was overdetermined by the presence of the woman's question (banning of sati, widow re-marriage, age of consent, etc) yet simultaneously undermined

by its studied dismissal of the voices of 'real' women; its inability to get beyond its position as a conversation between men about women.⁵ The importance of *Paulakhuna* lies in its attempts to represent the legacy of social reform as the story of woman's improvement. In doing so, I will argue, it forces us to come to terms with the ways in which television culture engages productively with the writing of women's history today; questioning the all too easy dismissal of televisual texts by scholars.⁶ It also tries to suggest that we look at the alternatives that mainstream, dominant television culture itself offers – however minimal, constrained, or co-opted they may be – rather than using television culture as a source which is then incorporated into academically stylised modes of reading that are not sensitive enough to the specificities of television broadcasting.

At first glance, *Paulakhuna* does indeed seem configured as yet another exemplary progress-narrative. It is this to some extent: I will later argue that the serial gives the category 'woman' a narrative fullness through the delineation of a progressively evolving feminine 'self'. Initially, my interest in the serial was sparked by what I saw as the convergence between the realm of televisual culture and the arena of history (as a specialised academic discipline with its own discursive modalities) that *Paulakhuna* seemed to map; at least as far as narratives about women were concerned. I was intrigued by the contemporaneity of *Paulakhuna* with the current historiographical interest in social reform.⁷ How was it that the question (drama, really) of the brahmin, middle class woman's improvement was enacted (in the serial) with the same teleological fervor and ventriloquial skill that characterised the debates of the social reformers? Why was the "evolution of Maharashtrian womanhood" being recreated for us as the story of her improvement at the very moment that feminist historiography was questioning her improved status?

Ramdas Bhatkal, in an interview, described the serial: "The writers we've chosen were those who wrote literature from a progressive perspective. They created literature that was sometimes in opposition to [the practices of the] time, and sometimes ahead of it."⁸ But we need to be careful about translating this progressive urge into the site of a perverse pleasure for the academic imagination (the popular as resistance, the location of polyphonous voices, etc). Given its progressive inclinations, *Paulakhuna* ended up mapping the popular as pedagogy: the serial was to be educational, a means of familiarising people with Marathi novels of which they were perhaps unaware. Because of its unusual format, watching the serial involved a degree of preparation which would be provided by the weekly previews in Marathi newspapers. In *Paulakhuna*'s role as pedagogical tool, as the Doordarshan equivalent of BBC's Masterpiece Theatre, the reliance on "great works" is an attempt to legitimise the serial by suggesting that it functions simultaneously as history. The translation of these Marathi novels into a visual narrative is partial, restricting itself to elements that emplot a tale of women's improvement through education. We see here the subservience of the individual novels to their grander design, and a flattening of the possibilities offered by the 'literary' in telling different stories.

The effect of television as a medium also contributes to the flattening process. Relative to the control the reader has in modulating her pace of reading, the televisual narrative constricts the interpretive rhythms of the viewing subject with its own inexorable pace. *Paulakhuna* is self-consciously about literature: it recreates the act of reading through the act of viewing. In the process, the telescoping of reading and viewing renders the activity of viewing transparent. For instance, Bhatkal notes, "These novelists and thinkers put forward many facets of the woman's question, and

Doordarshan is the most effective medium to draw attention to them. Books will have their impact slowly. But a Doordarshan serial can have an effect on the viewer while it is being shown." The simulation of viewing as reading renders unproblematic the pedagogic impulse underlying the particular reading. The process of viewing simulates the process of 'becoming educated' that is forefronted by *Paulakhuna* as the cause of woman's progress and improvement.

I

Paulakhuna began with a 'modern' young woman refusing to play the role of a passive, subservient wife abused by her alcoholic husband in the play *Ekaj Pyala* written by Ram Ganesh Gadkari. She fumes at home about the indignity of playing such a role, and questions the social toleration of such abuse. Thereupon her grandmother introduces her to her strong foremothers who fought for their independence and selfhood in a heavily patriarchal system. Her grandmother persuades her to understand and empathise with the struggle waged by (brahmin, middle class) women by reading about them. What follows is the young woman's journey through the literary masterpieces that posed various questions about women's lives in the late 19th and early 20th century. We 'see' what she reads. It might not be out of place to say a little about each novel here. The serial seeks to make the novel's protagonist singular yet representative (of Maharashtrian women of the time); presenting an individualised version of struggle to stand in for the forging of a collective identity based on familial oppression. I shall have to do the same for constraint of space.

Yamun in *Pan Lakshat Kon Ghet* is educated by her husband, who unfortunately dies, leaving her to suffer a widow's life, symbolised in the serial by the dreaded 'keshavapan' (shaving of the widow's head). In *Vidhwakumari*, Mathu is married off to an old widower who dies before she reaches puberty. Supported by her step-daughter (who is old enough to be her mother), she fights to wear the kumkum though a widow, saying that wearing the kumkum (as opposed to the mangalsutra) is not specific to married women, but is a right she has had since her childhood, and continues to have regardless of her marital status.

Neera in *Na Patnari Gost* is not a child-bride, but is married off to a widower by her maternal uncle and aunt after her parents die. She fights to retain her independence in her matrimonial home and slowly convinces her husband about the injustice of marrying someone young enough to be his daughter. He wipes the kumkum off her forehead, declares her henceforth a widow,

and tells her she is free to remarry. He goes to the extent of arranging a meeting with a young man her parents had wanted her to marry, suggesting that she marry him now. Neera decides to remain single, and devote herself to the uplift of women.

Susheela, in *Susheela Dev*, is married to a childhood friend. Susheela is initially religious, seeing god first in idols, then in her husband. After he brings home another woman, however, she begins to see religion in social service. After her husband's death she enrolls herself in a missionary school, and devotes herself to the uplift of the downtrodden. She also re-marries another childhood friend; in a marriage based on respect and equality.

Brahmankanya's Kalindi is the daughter of a brahmin man and the grand-daughter of a prostitute (on her maternal side). She leaves home to live with a Lingayat man, and has a child by him before he leaves her. She goes to work in Bombay, leaving her son with a good friend. There she gets involved with a trade-union leader, and marries him.

Shabari gets married to Abhiram. Though it is a love marriage, she lives with the persistent inequalities inherent in the family structure within a patriarchal society.

Manpala is about a working woman's evening in a Bombay chawl. Coming home from work, she is confronted with taking care of the household work, as well as sexually satisfying her husband. Her lack of interest in sex is woven into a portrayal of her dreary, everyday life between the office and home. The format of the serial is a framing of the novels by a discussion in the present about the novels' relevance. The discussion between the young woman, her boyfriend, his younger sister, their well-read (male) friend, and the ji-ji who has initiated the reading are efforts to encourage us to probe our modernity. The presentation of these interactions as purely dialogic is meant to erase any semblance of gendered power in the present. We can read this as further indication of the gap that separates us from the all too visceral issues that touched our foremothers. In this framework of debate, it is the male friend who holds forth about the importance of the novelist, their social context, the questions they posed, etc. Yet again the woman viewer is being guided gently through her history, it would seem.

Now I want to ask about this presentation of a narrative which presents us to ourselves as 'ourselves undressed', to paraphrase Michelle Z. Rosaldo (1980). Rosaldo writes about the tendency for western feminist anthropologists to view their non-western sisters as living in a time lag, where the encounter between feminist self and female other is often couched in a spatial (made temporal) divide which denies the non-

western woman a history. I find her phrase useful in this context also, where we are asked (and consent) to view ourselves as living in an utopian, modern present. We are asked to see our history as the traversal from victimhood to emancipation. We are able to view the woman on the screen across the distance afforded us by our modernity. Initially *Paulakhuna* necessarily invokes a doubled, ambivalent response: an empathy for the oppressed woman and her struggle for self-definition, as well as a refusal to consider the reasons for the continuity of these oppressions into the present, a studied denial of the claim that 'woman' might still be a troubled/troubling category.

Paulakhuna attempts to make the category 'woman' meaningful rather than troublesome, and it does so through the contours of a feminine self that emerges as the serial progresses. The emergence of this self is closely tied to its "educatedness" since it is this which allows for the articulation of its singularity. The argument runs thus: brahmin, middle class women were being educated. This allowed for the articulation of their experience, and the formation of an interior self-grounded precisely in the over-determination of such experience as (women's) history. It also led to the formation of an oppositional will which would enact women's history as improvement and progress. Education, then, was primarily about the simultaneous construction and knowledge about this feminine self.

What this educated self articulates, as I said earlier, is that realm of women's experience which functions as the foundation for the history the serial aims to chart. Making visible woman's experience is equated with charting her history. To that extent her history is obvious, self-evident; the Maharashtrian woman is the sum total of her experiences. Experience constitutes the grounds for self-reflexivity and understanding, and since 'woman' is the subject of this narrative, her experiences occur under the sign of 'oppression'. This tends towards representing 'woman' as an always-already oppressed category. Involved here, I would argue, is the satisfaction of the desire for a particular sort of narrative about the turn-of-the-century Maharashtrian woman. The empathy of the male novelist for the woman as victim, her narrative of strength-in-suffering, its closure in an utopian present which is seen to have resolved the woman's question to a certain extent, need to be interrogated not for what they want us to see so much as what we ourselves believe, given who we are today. How much of *Paulakhuna* is about the contemporary, male(?) desire for a particular kind of history of the brahmin, middle class woman? One that presents her countering the configurations of

patriarchal power, and obtaining education, emancipation, and progress?

To ask this question about desire in a slightly more tangible fashion is to ask about the underbelly of the notion of education as emancipation. S V Joshi's *Anandi Gopal* repeatedly recreates the experience of education as terror. Written in 1962, the novel is based on private letters between Anandibai Joshi (1865-1887) and her husband Gopalrao, newspaper accounts, and other written material; most importantly Kashibai Kanitkar's biography and collection of personal letters in *Anandibai Joshi Yanche Charitra Va Patre*, written in 1889 but reprinted in an abridged form in 1912, published by the Manoranjan Grantha Prasarak Mandal.¹⁰ At the age of nine Anandi is married to a man about whom "it was whispered that his first wife had died because he bullied her with his eccentric efforts to teach her to write" (1992: Foreword by Suma Chitnis, vii). Gopalrao desperately wants to marry a widow, but settles for Anandi instead, with her father's assurance that he (Gopalrao) will be allowed to educate his wife. "I am going to educate my wife to the highest standards possible... She will have to study all day. I will teach her English" (1992:25).

Gopalrao's desire to educate Anandi is matched by her reluctance to learn, supported in turn by the women in the household (Anandi's grandmother throws the books Gopalrao buys for her into the cowshed, for instance). Anandi agrees to learn after Gopalrao threatens to convert to Christianity and "discard" her if she doesn't, "You must like it [reading books] because I want you to" (1992:60). This conversation, her initiation into the world of education, takes place on the night she first has sex with Gopalrao. She is as afraid of the sexual act (because of Gopalrao's harsh, abrasive behaviour) as she is of the consequences of learning (the violence she will have to face from the women in the household). That Anandi's subjectivity is shaped by the violence of these encounters, will become clearer in what follows. It forces us to ask about narratives that would accommodate the contradictory intermingling of violence, pleasure, and desire accompanying women's education. Counterposing these 'dirty' categories against the sanitised versions of women's education questions the latter's presentation as a monumental event leading to women's progress.

Why aren't you sleeping then? [Gopalrao] wondered. "You haven't finished with me yet. What, what do you mean?" "The thing you do with me every night" (1992:68).

I would juxtapose this against Anandi's learning. Gopalrao asks her to draw the first letter of the alphabet.

Her hand was shaking. The tears welled up in her eyes. Gopalrao's hand was right behind her back. If she went wrong she knew he would hit her. She tried very hard for ten minutes, sweat was streaming down her face but she managed somehow (1992:64).

Anandi is also beaten by her mother for going up to her room during the daytime (considered shameful and wanton) to do her lessons, at Gopalrao's command. This further positions her at an oblique to the women of the traditional brahmin household where the education of women was viewed as the first sign of a threatening, perverse 'modernity'. It also points to the two notions of women's education that competed for hegemony. One occurred through lived experience: it was fuzzy, unrigorous, and need-based. The other was a different sort of an initiation. Systematic, methodical, and time-consuming, it was based on the notion of learning (and teaching) as occurring in a specific ideologically charged space. The following excerpt plays on the dual notion of being taught a lesson (by Gopalrao and her mother): She left [Anandi's] ear alone but she had a burning twig in her hand. She hit Anandi with it in such a frenzy, on her legs, on her back "You must be taught a lesson!" she said (1992:74).

We do not need to continue with Anandi's rather tragic success story in any greater detail. Having been educated by Gopalrao and then missionaries in Kolhapur, she goes to medical school in the US and returns after three years as Maharashtra's first woman doctor. Unfortunately she dies soon thereafter of tuberculosis. In the process of becoming educated, Anandi rewrites much of the story I am trying to tell, and gives us a textured feel for the (subjective) importance of education for women. But pausing here draws attention to the complications involved in a discussion of what becoming educated might have meant (and felt like) for women themselves. To that extent hopefully, it disturbs the tale of the always ready-to-be-modern subject.

While *Paulakhuna* certainly merits critical attention, it is important to note that in the serial, the category of 'experience' allows the feminine self to emerge in history with a certain amount of agency. Most importantly, it is 'experience' which upsets the story of progress towards the end of *Paulakhuna*. If S V Ketkar's Kalindi in *Brahmankanya* posed the question of woman's economic independence as indexing her true freedom, her freedom to choose, Shabari and *Manjula* complicate the very notion of choice.¹¹ To paraphrase Chitra Palekar, *Paulakhuna*'s script-writer, "As we approach modernity some problems are resolved but new ones crop up".¹² They map out the subtler, more complicated forms of oppression located in the middle class, urban, nuclear family; especially when that family's

ostensible framework is the love marriage. The operation of patriarchy in its everyday, banal forms, its internalisation by the female subject, and its role in the construction of her subjectivity begin to problematise and complicate *Paulakhuna*'s own story, and it begins to disintegrate. The interiority of the feminine self, which *Paulakhuna* has alluded to all along, demands a voice (coincidentally this is inaugurated by the first and only woman writer in the series),¹³ and proceeds to ask the question: are we really so modern?

Accepting the importance of experience as a category of analysis in feminist theory and practice, Teresa deLauretis has written about its processual nature as well as the need to problematise it:

Through that process [experience] one places oneself in social reality, and so perceives and comprehends as subjective (referring to, even originating in, oneself) those relations – maternal, economic and interpersonal – which are in fact social and, in a larger perspective, historical (1984:159).

With this in mind, let me ask a question. So far it is the brahmin, middle-class woman's position in the family, her struggle for individuality in the context of a violent attack on her body and sensibilities, which has become representative of woman's experience. Given the need to locate the specificities of subject formation through the category of experience, why is she the site of, and partial agent to, history-making? Why is her history – complex and contradictory though it may be – the history of the category "the Maharashtrian woman"?

II

Though it may seem like a digression, I would like to speculate about the curious ways in which recent historical writing might also participate in this blindness towards the specificity of the brahmin, middle class woman's experience as history. (My interest will be focused on the elision of narratives of caste.) This is on the one hand to listen to the echoes between history and the popular (here, television culture). Specifically through the various ways in which history (however, radical and/or exclusive it might be) is taught, transmuted, and transformative of people's lives: how it lives in popular memory, so to speak. On the other hand I want to try to disentangle a problem troubling me. This has to do with the ways in which an agenda for a feminist historiography risks suggesting that work on gender (no doubt a rather marginalised activity), because it is about gender, is somehow excused from its caste (mainly) and class-specificity. I am not talking about the oft-repeated injunction to take caste and class (along with gender) into account. Its importance is

widely acknowledged, and springs to some extent I think, from the sense that the holy trinity "cover" all the possible cases of oppressive and/or subaltern positions. Needless to say this runs the risk of assuming that the work done by each category is similar; that it mimics what the others do, and closes off the possibility of exploring the ways in which they complicate, interact, and exist alongside each other. Rather I am addressing myself to the (theoretical) framing of certain questions which makes the taking of caste (especially) difficult, if not near impossible. In this symptomatic reading of Partha Chatterjee (1989), I will stick to those points that resonate with *Paulakhuna*. Hence the limits of this exercise will be obvious.

Chatterjee situates the (brahmin?) middle class woman (especially her body) as the silent participant in the construction of an Indian nation worthy of countering colonial rule. Through a suggestion about the interpenetrability of nationalist and social reform discourse, and, the eventual sublation of the latter by the former, Chatterjee argues for the importance of social reform (especially the woman's question) in the nation's narrative about itself: in fact that woman's question is about the inner, hidden self of nationalism. Coincidentally, *Paulakhuna* begins at about the same time that Chatterjee locates the disappearance of the woman's question from "the agenda of public debate" (1989:233) and the increasingly political character of nationalism. There is a striking absence of reference to nationalist politics in *Paulakhuna* – the result of a conscious decision justified by the technical problems of time-constraint – but the nation and nationalism cannot but be an absent presence for viewers.¹⁴ This seems to lend credence to the idea that nationalism and the woman's question cannot occupy the same discursive space, that they construct themselves as mutually exclusive yet constitute of each other. In addition *Paulakhuna*'s novels fall under the purview of those personal writings Chatterjee suggests we look to for the struggles of women. Chatterjee acknowledges that the 'stuff' of woman's history is located in the interior through a striking reification of the political and the social/cultural spheres. He writes:

We would be mistaken to look for the evidence of such a struggle [by women themselves for equality and freedom] in the public archives of political affairs, for unlike the women's movement in 19th and 20th century Europe, that is not where the battle was waged here in the era of nationalism. The domain where the new idea of womanhood was sought to be actualised was the home, and the real history of that change can be constructed only out of the evidence left behind in autobiographies, family histories, religious tracts, literature, theatre, songs, paintings

and such other cultural artefacts that depict life in middle class homes. (1989:250)

I agree with much of Chatterjee's insights about nationalism's 'new woman' and the peculiar modernity she was to represent. His provocative thesis offers a powerful heuristic map of what has been a hitherto relatively uncharted domain. But Chatterjee's language of separate spheres runs the risk of reifying his binaries and embodying them with a weighty reality.

Working with material/spiritual as the organising binary, Chatterjee goes on to locate it spatially outside/inside, and then literalises the entire venture with 'bahir'/'ghar'. Rather than showing how these have come to be associated with a gender distinction, he merely asserts that "It [bahir] is typically the realm of the male. The home in its essence must remain unaffected by the profane activities of the material world – and woman is its representation" (1989:239). This works on the assumption of a 'fit' between 'real' social space, and the gendering of these spaces, without questioning the slippage.¹⁵ Rather than remaining a useful heuristic device that might facilitate our thinking about the incompleteness and peculiarity of Indian nationalism, it runs the risk of exhibiting Chatterjee's own binarism of thought. Take for instance his claim that "The content of the resolution was neither predetermined nor unchanging, but its form had to be consistent with the system of dichotomies which shaped and contained the nationalist project" (1989:244). It is unclear to me whether the dichotomy of nationalist thought is alluded to, or given a duality that it perhaps did not always exhibit. Is this the use of the binary in a descriptive exercise, or is binarism given an intrinsic explanatory value much like in the Levi Straussian model – where nature becomes culture through the traffic in woman as sign?

Instead of launching an attempt to question these divisions as the inheritance of a bourgeois historiographical tradition – Chatterjee himself suggests this at the end of his article when he calls these binaries 'false essentialisms' (1989:252) – a major portion of the article seems to take these binaries at face value; as having a reality which allows them to be deployed effectively. It is silent about the effects of recreating the public and private in the historical writing about women's lives (which is itself a political act with real consequences for the women who are representational subjects of that narrative), and runs the risk of launching a search for an Indian private (feminine) self (whatever be its eccentricities) largely as it emerges through autobiographical and other personal writing. Precisely because we are told that this is the strength of Indian nationalism: its construction of an inner,

feminine self. Inadvertently this self, demarcated as feminine and middle class, would be endowed with the historic task of writing the nation's autobiography. If nationalism writes its history on the middle class woman's body, then clearly even critics of the nationalist project need look to her to point to the contradictory, incomplete, dichotomous character on Indian nationalism. The middle class (brahmin?) woman is marked perhaps as the site of negative desire, but desire all the same, since her history is the necessary complement to the political face of nationalism. Can the focus on desire prove to be useful in talking about the ways in which history writes women into the picture as desirable subjects?

What would happen if we included the narratives of caste, which Chatterjee scrupulously avoids. In his narrative, the nationalist self is devoid of the markers of caste. The hesitation to look at caste practices as forming antagonistic, if not parallel narratives to the ones we have before us, indicates the unease in acknowledging that caste too shapes the nationalist self. In the context of Maharashtra, where the non-brahmin movement and the "Dalit" movement led by Ambedkar offered trenchant critiques of nationalism as a form of neo-brahminism, the interior and exterior facets of nationalism might themselves achieve their unity at the cost of ignoring the ways in which caste structures public and private lives. The suggestion here is that we need to ask why, and in what important ways, nationalism secures its status as an upper caste, middle class phenomenon, so that we might more sensitively acknowledge its effects on other's lives. The distinctions of public and private might serve to occlude, rather than explain, these processes. For instance, where is the lower caste maid-servant who straddles these spheres. Where in this seamless web of middle class desires might we position the lower caste educated woman symbolised in Maharashtra at least by the figure of Savitribai Phule.¹⁶

Contrary to nationalism [and the historian]'s discomfort with caste as making the middle class self, *Paulakhuna* acknowledges caste as quite central to its narrative; the 'interior' thrives on its caste-specificity. Caste emerges as a critical component of the 'feminine self' and her experiences in the family. The oft-cited reason for *Paulakhuna*'s focus on the brahmin household followed from the fact that the novels were written by brahmins (and men at that). It was presented this way in a discussion between the moderns about Brahmanikanya. V B Deshpande puts it this way:

The first 70-80 years of modern Marathi literature was dominated by brahmins...But we cannot find fault with them. If I haven't

lived in a *zhopadpatti*, then there is no point in my writing about false experiences. If I haven't [ever] lived in the *Maharwada* or the *Mangwada*, then how will I write about it?... "Rather than writing falsely, it is better to describe the world of the middle classes in which I have lived". The writings were written with this intention... The reader comes from the same [social] background as the writer. If there is a *Yamu* – or a *Subhadra* – in the '*zhopadpatti*' I'll ...read about her for interest, because it is something novel, but I won't become one with her grief and sorrow.¹⁷

Clearly this unbroken continuum between the text and reading mirrors the intentions of 19th century realism, which sought to construct a reading public along the lines of a particular experience of social reality. In *Paulakhuna*'s case, the identification with the novel runs along the contours of caste because it shapes the realm of woman's experience as well as the writer and the reader's subjectivity. The readability of the text and the positions for identifying with the novel, are rooted in certain experiences of caste in the home. The outcome is that certain stories can be found in certain places: the novel is by nature an exclusive form, at least initially. But as de Lauretis has noted in another context, "A story too is a question of desire", and the question before us is about the story broadcast television wants to tell (1984:112). The complexity of thought, action, and feeling that accompanies the middle class woman's development within and later outside the brahmin home becomes a hegemonic narrative. Hegemonic not because it is monolithic, but because it is layered, diffuse, subtle, and complicated; as one's subjectivity is bound to be. The fullness of this category, the Maharashtrian woman, as what Denise Riley has referred to as the surfeit of identity assigned to 'woman' (or women) as a category. "Can anyone fully inhabit a gender without a degree of horror? How could someone 'be a woman' through and through, make a final home in that classification without suffering claustrophobia?" She asks (1988:6). Perhaps an inattention to the ways in which caste frames the middle class women's subjectivity in *Paulakhuna* allows us to inhabit a category shot through with horror, rather than questioning the horrors we ourselves have perpetrated (in the same of caste). *Paulakhuna* allows us to rest content that our history as women has been about struggle, sacrifice, and suffering, without taking into account the fact that the narratives of caste might not permit these same stories for other women; that caste fractures the narrative of 'suffering as a woman' quite drastically.

I have posed a series of question about the exclusions and silences whereby *Paulakhuna* succeeds. Again, it succeeds not because it frames a totalising narrative,

but because it works through contradictions that exist at the level of individual subjectivities, experiences, and desires. Does the female subject as viewer have a position from which she is able to view her history as something other than state-sponsored education, compliments of Doordarshan? A fruitful way of describing the process of viewing could be through the notion of accessing a televisual text.¹⁸ Here, the act of reading the text from a socio-politically constituted, gendered position is complemented by one's own life-history: meaning is completed by the understandings one brings to the text. This rewriting of the hegemonic narrative can work as a disturbance or interruption of what's 'on TV'.

Through the serial, we (as women viewers) are given a history of our struggles and sorrows; consolidating the sense of a community of the oppressed. But how one might represent the fragmented subjectivity of women, and thereby question the reified category 'woman' through a medium that has opted for the filter of realism for 'women's issues'. As feminist critics of the media have noted, the cinema of realism has as an implicit corollary of its 'reality effect', the solidifying of patriarchal attitudes towards women. This is because the structure of the visual gaze is voyeuristic; seeing women through a male perspective.¹⁹ The elision here of the crucial component of visual pleasure is also well known via critiques of 'screen' theory. In *Paulakhuna*, which attempts to chart a history, the 'reality effect' must be taken on at the level of the visual narrative, as well as at the level of the novels that function as a historical source or document of 'what really happened' to women. History, 'realist' novels, and Doordarshan collude in the claim to representing a particular brand of the real Maharashtrian woman. This reality helps and hinders the feminine subject. If the claims of historical change are taken seriously, they could be seen to provide a space for the contestations and struggles of women. At the same time, the constraints of form render the serial incapable of 'seeing' women except through the lens of suffering, sacrifice, and struggle within the confines of a family narrative; a narrative that lets them down anyway, at the end of it all. I think the uneasy tension between these two positions maintained by *Paulakhuna* leads to its overturning the normative televisual narrative. It is this possibility that this piece has attempted to chart out.

Notes

[I would like to thank Ramdas Bhatkal, V B Deshpande, Veena Dev, and Chitra Palekar for giving generously of their time, Arvind Rajagopal for his incisive criticism, and V V Modak for his invaluable help with Marathi.]

1 There was also some coverage in English newspapers. As far as the Marathi coverage goes, I am familiar with coverage in newspapers popular in the Bombay-Pune belt; especially *Kesari*, *Lokasatta*, *Maharashtra Times*, and *Sakal*. *Kesari* and *Sakal* carried weekly preview written by professors of Marathi literature, Veena Dev and V B Deshpande, respectively. *Maharashtra Times* carried write-ups supplied by Popular. I cannot claim to know about media coverage in southern Maharashtra and the Marathwada and Vidarbha regions.

2 *Paulakhuna* began on September 14, 1993 and ended December 21, 1993. The serial was broadcast every Tuesday (with a few intermittent misses) at 7:47 pm (!) by Bombay Doordarshan.

3 *Popular* is famous for its publication of Marathi literature and criticism, and its English social-science and medical texts. In 1989 *Popular* began publishing a series, *Streemuktichya Maharashtraatil Paulakhuna* (Footprints of Women's Liberation in Maharashtra), which focuses on writing by women encompassing the bhakti poets, women's writing during the Peshwa times, during the 19th century, and interviews with present-day women writers. Seven books have been published under this title to date.

4 Interview with Shrish Paw in 'Streejeevanavishayak Doordarshan Malika: *Paulakhuna*', *Lokasatta*, September 5, 1993 (my translation).

5 See Mani (1989), and Kosambi (1991).

6 It seems to me that this implicitly involves looking at the differences of the televisual medium that might modify or redefine the literature on feminist film theory. This piece does not attempt this.

7 The interest in historicising women's oppression and women's attempts to break out of oppressive structures differentiates *Paulakhuna* from the other serials about women. For instance, Punwani mentions the domestication of the numerous, ostensibly progressive, televisual narratives about women (1988). *Paulakhuna* is important precisely because it holds dear the moment of struggle and change, and focuses on a (limited) critique of turn-of-the-century family practices. This is not to hold up the serial as exemplary, but to mark the moments that do depart from conventional televisual narrative in however a limited fashion.

8 Interview in 'Streejeevanavishayak Doordarshan Malika', *Lokasatta*, September 5, 1993 (my translation). Interestingly Bhatkal speculated that it was the fact of these novels being Marathi literary classics which contributed to certain 'radical' statements being allowed by Bombay Doordarshan during the course of the serial (personal interview December 6, 1993). Their canonical status as great literature put them into a different category, and allowed certain scenes to bypass the censors (Bhatkal made specific reference to *Brahmankanya*). This is an important point given Doordarshan's strong interest in maintaining the family as an ideological unit *par excellence* through television broadcasting.

9 *Ibid* (my translation). In an interview with Chitra Palekar (November 25, 1993) she talked about the power of the remote in the viewer's hand, and her attempts to make the serial contemporary and interesting so that people would watch it. Clearly we need to be aware of this aspect of the production also.

10 Kashibai Kanitkar was a novelist in her own right. She wrote two novels, several short stories, essays, and reviews, and maintained a long-lasting intellectual friendship with Hari Narayan Apte (Tharu and Lalita, 1991). See Vaidya (1991: 282-83) for a list of Kashibai Kanitkar's publications.

11 Attention must be drawn to the complexities of *Brahmankanya's* narrative since the serial is unable to recuperate and proceed teleologically after Ketkar's novel. It moves away from outlining rebellious actions to a focus on woman's interior (in Shabari). This has a great deal to do with issues posed by Ketkar. This is the only time caste and caste prohibition become topics of discussion in the serial. Kalindi's father says in Paulakhuna that he married his wife for the cause of 'samaj sudharna' (improving society). He works under the legal notion of a wife and children as belonging to their husband/father's caste. In Kalindi's case she lives with a lower-caste man. Since caste is earned by men, she has lowered her caste status. This is as important as the fact that she merely lives with him, threatening the sanctity of the patriarchal family. There is also a theoretical discussion about matriarchal and patriarchal family structures in the serial. After this assault on the family structure, Shaban and "Manjula" revert unquestioningly to that selfsame structure, and talk about the problems within them in a different way. This points to the inability to imagine an alternative to the middle class family as we know it. I would argue that the discussion about caste (which is inextricable from discussions of the family) in *Brahmankanya* serve to derail the teleological narrative as much as Shirurkar's inauguration of a feminist voice which problematises the "modern" woman. S V Ketkar is quoted as saying, after reading Shirurkar's short stories, "Men will never be able to understand women's mind using their own logic. For society to understand women's minds, women must speak" (Tharu and Lalita 1991: 425).

12 Personal interview, November 25, 1993.

13 I don't mean to essentialise this point, which would be difficult anyway given Arvind Gokhale's sensitive mapping of Manjula's subjectivity. At the same time of course, we do need to be sensitive to the positions from which women write and read. It seems to me that rather than asking the question of men's or women's writing, it would make more sense to question why and in what ways the development of a modern (middle class) subjectivity through the novel form is itself associated with a peculiar sort of an interior, which women are seen to possess. That way one might link the specific history of the rise of the Marathi novel with the question of who writes (and of course, who

doesn't). There is also the question of reading: the politics and pleasures of reading might not always be modulated by the knowledge of female authorship *per se* (i.e., they might not locate female subjectivity in women's writing exclusively). Rather, they might be motivated by the stylistic and formal pleasures of genre. Though *Women Writing in India* claims Vjbhavari Shirurkar for their anthology of feminist writers (see pp 424-26), Paulakhuna locates her work within a very different trajectory, that of reformist writing, to put it crudely. It is Shirurkar's mastery over form and content that Paulakhuna draws on; both R Bhatkal and V B Deshpande spoke of the lack of notable women novelists as contributing to their focus on male novelists. Clearly, these two very different positionings of women's texts raise questions about our own politics of reading (the desire to read as feminist readers perhaps?) which makes us see a work by a woman writer as essentially different. This does not suggest that we ignore the difficult objective conditions under which women write.

14 In talking about the pressure to fit a novel into two episodes of the serial, Chitra Palekar was quite clear about the fact that the woman was central in *Paulakhuna*, and making reference to nationalist politics would only draw attention away from the serial's focus. Clearly there was no necessary connection between the two; so much so that we could pretend that nationalism had completely passed women by. Doordarshan is a set of state-regulated socio-technological practices, and undoubtedly it has its obdurate constraints. But these are finally mediated and resolved at the level of social practices (what is important, what is not, etc). I am pointing to this facet here.

15 I would also point to the slip between 'male' and 'female' - terms of sexual difference - and 'man' and 'woman' as socially constructed categories in Chatterjee's passage. Typically, accounts of the socio-political nature of women's oppression have delinked the two to avoid the trap of biologism. It is troubling to see them elided here because it points to the literality of Chatterjee's argument (male = man and female = woman). Gender seems to be attached solely to women, who then become a special category to be retrieved from the inner, private recesses of the home for history. But 'woman' as an overdetermined category perhaps stands in for the family (as a historically constituted structure) rather than the home (which retains its connotations of a spatial organisation). Her oppression becomes a family issue (wife-beating, dowry-death, etc) and serves to further interiorise the all too political and public characteristics of control over the family (though the juridico-legal apparatus which regulates inheritance, succession, etc, to give an obvious example). Questioning ghar/bahar distinctions would lead to examining the discursive connections between these discontinuous domains. Recently Judith Butler (1990) has argued for the discursively constructed, unnatural (political and performative) character of

sex; of sex itself as already gendered. I think this allows for a more sophisticated sense of gender (and sex) as shifting, historically constituted entities.

16 Clearly, we can also talk about the lower-caste, especially dalit, woman as a site of desire, and more importantly, the target of institutionalised upper-caste violence (through rape, sexual harassment at work, etc). But this is part of another argument...

17 Personal interview with V B Deshpande, November 18, 1993 (my translation).

18 Hartley, who I borrow this term from, writes: Viewers 'access' television discourses and representations both in and beyond the act of watching television ("accessing" goes on after the television set is switched off). And vice versa: television accesses its viewers' (culture's) discourses and identifications in the act of production (1992:28).

19 See Lakshmi (1988), Punwani (1988), and Tharu (1986). I am indebted to their arguments.

Is There Hope for the Indian Economy?

Romesh Diwan

I READ with interest the commentary, 'Between Friends: A Conversation'.¹ Both Ashok Mitra and K S Krishnaswamy have been involved with economic policy and ideas for many decades. Ashok Mitra was my teacher, from whom I learnt some of the intricacies of econometrics. I have read his 'Calcutta Diary' regularly and found it, always, incisive. It requires guts to publish thoughts written for private use, particularly when Krishnaswamy writes about his unhappiness "because of the involvement of persons who I have been friends with for a long time" and "because I think *they have been knowingly dishonest*";² a courageous act indeed specially when these friends are still in high office. It is a fascinating reading. Our hats to these two stalwarts and thanks to the editors for publishing it.

It made me reflect a little. Married as I am to a US 'upper class' white American university professor, it gives me a useful vantage point to observe and understand myself, other Indians and some aspects of India. As I read this piece, I was reminded of the scenes in Mahabharat where Bhisham, Dronacharya and Vadur regularly talk about Dhritrashtra's 'moha', Duryodhan's 'ahankar', and their 'adharma'. All three had feelings of anguish and yet were unable to act in favour of 'dharma' because of their perceived sense of loyalty. Bad things were happening, they recognised it but could not help change it for the better. It is at the end of his life when Bhisham was suffering his death on the bed of arrows that he realises, as he explains to Arjun and Yudhister, that his grand blunder was his inability to distinguish between two paradigms defined by (i) Raja and (ii) Rajya. He had a loyalty to the Rajya of Hastinapur but confused it with that to Dhritrashtra, the Raja. Something similar is happening in this conversation. Two highly placed officials in previous governments and scholars are in anguish that country is sliding downwards but are unsure if they can do anything useful or helpful.

Part, if not most, of the source of their anguish lies in a similar error where they, like most experts, are unable to recognise the implications and limitations of the ideological paradigm of the western rationalist thought based on a mechanistic world-view. All modern science and expertise, including Marxian, is based on this view. This world-view came into being in 17th century Europe to explain and justify capitalist modes of production and exploitation. The fundamental social and intellectual problem then was that of order. The image of nature and woman in this period was one of being chaotic and disorderly, so that both had to be controlled, dominated and subdued. Even today, this

mechanistic view "taught in most western schools is *accepted without question* as our everyday, common sense reality... as a conceptual framework, the mechanical order had associated with it a framework of values based on *power*, fully compatible with the direction taken by commercial capitalism".³ The brilliant achievement of mechanism as a world-view was its re-ordering of reality around two fundamental constituents of human experience – order and power.⁴ Accordingly, what is missing in this conversation is a lack of questioning; why has the situation in India moved in the direction it has? The late V K R V Rao, in one of his major papers in 1970s, argued persuasively that most of the 'plan expenditure' was not for the benefit of the poor. It was instead for infrastructure to help promote the capitalist and business class. Arun Shourie provides concrete examples that the current situation is a natural progression of Nehruvian policies to create and strengthen the business class which would eventually take over the government and the country.⁵ These were initiated in early 1950s when Nehru, his political followers and their handmaiden intelligentsia, mesmerised by western rationalistic ideas, followed plans, policies and practices in the name of the society but for the benefit of the rich and powerful. This was, has been and still is, development of the trickle-down, spread-a-little-around, talk-of-plans but fiddle-with-the-middle variety. In fact these policies have been successful. The desired moneyed class has matured and as expected has taken the country over; the bride which has been readied for so many decades has now been married off. Why this lament?

A conceptual framework is consistent with a particular ethical framework. The conceptual framework of market ideology requires, in an essential way, an ethical framework of corruption, lack of integrity and of character. AM's concern in his first letter, that "the most staggering development is the obliteration of old scales of values and their supplanting by moral – and decency – codes transmitted by the satellite television channels"⁶ misses the relationship between the conceptual and value framework. The link between market ideology and corruption follows logically. Market ideology imparts desirability to profits. Profits follow from exploitation based on the use of power. Power corrupts. Those who can influence relevant legislation or regulation that helps them use their power make legal profits. Mafia types lacking the legalisation capacity use their raw power directly. Thus corporations raise prices by creating a monopoly through advertisements exempted from taxes, pay lower wages to workers

by encouraging governments to maintain high unemployment, and transferring costs to any other groups they can by externalising. Getting government officials, political and bureaucratic, to follow such policies for a small payment is a normal business expense and practice. The evidence of such corruption is everywhere; Japan, USA, Italy, Mexico, Nigeria. How can India be different? Without corruption the market system, even under the watchful eye of a planning commission, will not function much less survive. Need there be surprise when AM in his second letter makes the statement, "I still remember the ecstatic praise the Fund-Bank pundits would shower on black-marketeters throughout the 50s and 60s."⁷ After all, is not blackmarket a market? What if the market is black? What is important is that it is market. Its blackness can be changed to whiteness by 'reforms'. Non-white Asian Indians have been changed to behave like whites; in dress, language, table manners, prejudices, etc. Changing markets should be a comparatively easy task. Are not the Bank-Fund consistent in promoting these 'economic reforms'? Is not the major objective of these 'economic reforms' to white-wash?

It is interesting to read about the country's "servility – to government, to custom, to the developed 'white' world, to a host of other forces considered superior". Once again it is not a creation of these few years. Has not the ruling RNI society been promoting such servitude all these 50 years?⁸ In fact it lies deep in not only colonial ideology and what Albert Memmi calls colonial minds, but in the very acceptance of the western rational thought whose major objective is to describe, explain, and justify exploitation as well as rape of nature, women and the colonised people by those in power. It condemns and marginalises all thought and ideas based on principles of whole, unity, organic by denouncing them as inferior to scientific ideas that proceed from parts. It implies the principle of divide and rule. Since Gandhi's death, the power structure in India controlled by the RNI has been condemning everything Indian; its civilisation, its values, its heritage, its dress, its food, its rituals, etc. The westernised Indian, proud of his/her rational attitudes, has simply adopted the prejudices of the colonial white male; except when it contradicts one's own ego. This too has been successful in achieving its objectives. Should it surprise any one that the natural consequence of these karma is to damn the very Hinduness and Indianness, including the Indian person? Why should any one respect or trust an 'Indian expert'? Does it not contain the adjective Indian which is an automatic denunciation? When Krishnaswamy writes in his second letter, "As you know, what we say has little value, unless it is confirmed by *some white man*"⁹ he misses the history

of Indian colonialism and its continuance in the last five decades.

Most economists of right or left have mistakenly accepted the fallacious idea that the ethical framework is independent of the conceptual framework. Similarly they have accepted another equally fallacious idea that economy and society are independent of each other. The economics textbooks rarely talk about social problems such as poverty, arms race, polluted environment, breakdown of the family, violence in streets and homes. It is fashionable, for example, to find explanations of social problems everywhere else but not in economic policy and institutions. In fact, and in real world, economy and society are highly interrelated so that most of the social problems emanate from, and get aggravated by, the economic structure, ideas and policies that a country promotes. The economic policies implied in the market ideology conceptual framework are destructive of all the sustainable functions in the society. Because of such inter-relatedness, the current 'economic reforms' are bound to place still greater stress on the Indian society to possibly a breaking point. In this sense both AM and Krishnaswamy are right in reaching the conclusion that this can lead to a "bloody and anarchic" change.

Unfortunately, history does not provide many examples, much less an assurance, that the 'collapse of irrationality' will come about by the uprise of the oppressed, however logical and rational it may sound. Even if such a change takes place, it can, and will, introduce its own irrationality because this whole 'rationality' is based on divisiveness. A positive change will need a paradigm shift of ideas; a different conceptual framework with its consistent ethical framework. Its underlying principle has to be integrative and not divisive. The ethical framework is clear: it is one where personal integrity, quality of personal character and commitment to public good at a high personal cost are not only honourable values in themselves but also considered honourable and desirable by the society. It is also clear that these ethical values are not consistent with the conceptual framework of planning, market ideology and 'economic reforms'. The conceptual framework that is needed, then, is the one based on organic and holistic ideas best articulated by Huxley's *Perennial Philosophy*. It is a framework that promotes, not destroys, sustainable functions of man, woman, family and nature. It is a framework that assigns a higher image to humans than merely physical beings who can be satisfied by material goods so that progress is not measured only by the multiplication of material possessions and increases in physical comforts.¹⁰ It is a framework that promotes well-being of humans and nature and not their exploitation and the exercise of power. Since human welfare is not possible without community of which family is the basic unit, it is a framework that exalts, strengthens and stabilises the family, neighbourhood, mohalla and village. Fam-

ily, not the individual, has to be at the centre, and litmus test, of all economic and social policy. Thus, every activity and institution that weakens the family has to be taxed heavily. Similarly every activity and institution that promotes the cohesiveness of family and community has to be subsidised. It is such a paradigm shift that some of the avant-garde thinkers are working on. It was this paradigm shift that Gandhiji had articulated in his immense wisdom. He had even developed a part of the framework in the concept of 'swadeshi'. Sadly, and unfortunately, the RNI intelligentsia ignored and condemned it; partly because it is a Hindi word and has images of the Hindu heritage, both anathema to the 'rationalist' colonial minds. There is a need for AM and Krishnaswamy and all others who care about this country and society to rethink about their own paradigm and revisit Gandhian ideas; this time with some humility and objectivity. From my vantage point, I am convinced that in this paradigm shift and Gandhian paradigm alone lies hope for the Indian society, though not for the 'reform led' Indian economy as we understand it today.

- 8 I have developed the concept of RNI - Resident Non-Indians - and explained it in Romesh Diwan, 'Minorities, Development and Communalism', *Gandhi Marg*, Vol 15, April-June, pp 5-23. This generated a healthy debate with Rajmohan Gandhi in the different volumes of *Gandhi Marg*.
- 9 EPW, October 22, 1994, p 2785 (emphasis added). It is interesting that the lament is against the white man, not a Japanese who is also part of the success story.
- 10 "The physical approach to life has become a kind of epidemic in modern industrial civilisation...Never in the history, to my knowledge, has a civilisation reflected a lower image of the human being: a physical, chemical organism with no motivation than self interest, no aspirations that cannot be fulfilled on the physical level...Believing that the human being is physical, we have by some three centuries of concentrated effort developed the technology to do what we like in the physical world. We have an unprecedented capacity to pursue material goals and produce material goods to satisfy every desire. If the physical image of man is accurate, we in the United States must be living in the Golden Age". Eknath Easwaran, *The Bhagavad Gita for Daily Living*, 3 volumes, Petulama, CA, Nilgin Press, 1984, pp 10-11, Vol 3. I have argued that there are two types of affluences, one defined by material goods and the other by the care of those for whom we care. FERTILITY BEHAVIOR OF TRIBALS IN RAJASTHAN

By
B C Mehta

The present study investigates the data pertaining to 269 households from eight villages in Udaipur, Dungarpur, Banswara and Sirohi districts of Rajasthan. The book attempts to analyse the fertility behaviour of people living in the predominantly tribal region of Rajasthan. Generation gap and fertility decisions with policy implications have also been studied.

EQUITY ISSUE AT PAR

OPENS ON 14TH MARCH, 1995

ISSUE OF 5,00,00,000 EQUITY SHARES OF RS. 10/- EACH, FOR CASH AT PAR
AGGREGATING TO RS. 50,00,00,000

HIGHLIGHTS

- Promoted by the Housing Development Finance Corporation Limited (HDFC), a premier housing finance company in India
- Strategic alliance with NatWest Markets, the world-wide investment banking arm of the NatWest Group, United Kingdom

RISK FACTORS

Internal

- HDFC Bank Ltd.'s operations would be centred mainly in Metropolitan and Urban Areas which are already highly saturated with banking services, in view of this, the Bank will have to face stiff competition from existing and future commercial banks

External

- Interest rate and disintermediation risk due to deregulation of the domestic financial system
- Lending risks associated with banking business
- Risks from government policy changes
- Risks involved in the start-up of a new bank

MANAGEMENT PERCEPTION OF RISK FACTORS

- The Bank has instituted a system which will continuously monitor the changes in the economy and consequently be in a position to reasonably assess and pro-actively position itself vis-à-vis interest rate fluctuations
- The Bank has an appropriate credit appraisal and review system, by virtue of which lending risks will be kept at manageable levels
- The Bank has an experienced management team and professionally qualified staff and will be able to effectively compete with the existing and new commercial banks

CEILING ON APPLICATION

- Investors may note that an application can be made for a maximum of 20,00,000 Equity Shares

"If the Bank does not receive minimum subscription of 90% of the issue amount on closure of the issue, the Bank shall forthwith refund the entire subscription received. For delay beyond 78 days, if any, in refund of such subscription, the Bank shall pay interest as per Section 73 of the Act."

PUBLIC ISSUE OF 27,80,000 EQUITY SHARES OF RS. 10/- EACH FOR CASH AT PAR AGGREGATING RS. 2,78,00,000/-

HIGHLIGHTS

- 1 Project enjoys locational advantage of being situated near Bombay which is one of the biggest centres for consumption of petroleum products
- 2 Project appraised and financed by Dena Bank
- 3 Firm Equity participation by 20th Century Mutual Fund, BOI Mutual Fund and NRIs
- 4 The plant has flexibility to modify the capacity between Transformer Oil and Microcrystalline Wax, subject to maximum of 6000 TPA
- 5 Environment friendly process for Re-Refining of waste oil
- 6 Backward area benefits, including State Subsidy and Sales Tax deferral equivalent to investments in fixed assets under this project.
- 7 Easy liquidity -- Listing at Bombay, Madras and Ahmedabad Stock Exchanges

RISK FACTORS Internal (To The Company)

- 1 The capital subsidy of Rs. 25 lakhs is yet to be sanctioned by SICOM
- 2 Company is yet to receive final sanction for the term loan
- 3 Requirement of Working Capital will be appraised by Dena Bank in due course
- 4 Out of the total requirement of 300 KW of electricity, 125 KW has been sanctioned and balance is yet to be sanctioned

External (To The Company)

- 5 With the entry of multinational oil companies/brands, the petroleum industry is expected to become extremely

competitive

- 6 Recent Import liberalisation may affect the indigenous production due to lower prices and better quality
- 7 Any changes in Government Policies will affect the performance of the Company

MANAGEMENT'S PERCEPTION OF RISK FACTORS

- 1 The Company has already made an application to SICOM for the eligible portion of capital subsidy. The disbursement of the capital subsidy will start after the plant is commissioned
- 2 Dena Bank has already given in-principle sanction of term loan and final sanction is awaited. Disbursement will be made only after full subscription of the Issue
- 3 The Company's application for Working Capital facilities has already been made to Dena Bank and will be sanctioned before the commercial production starts
- 4 The Company has already made an application to the State Electricity Board for the balance of electricity load requirement which will be sanctioned before commissioning of the plant
- 5 The Company would be marketing its lubricants and greases in bulk. Since the total sales of these products in quantitative terms is in fraction percentage of the total lubricant and grease market in India, the Company is confident of meeting the target of sales of these two products in Maharashtra itself
- 6 Following the recent decanalisation of import of various petroleum products by the Government, the Company has an advantage of importing the raw materials at lower prices and better quality in the international market

Firm participation by 20th Century Mutual Fund: Rs. 20 lakhs, BOI Mutual Fund: Rs. 28 lakhs, NRIs: Rs. 55 Lakhs.

IF THE COMPANY DOES NOT RECEIVE THE MINIMUM SUBSCRIPTION OF 90% OF THE ISSUE AMOUNT INCLUDING DEVOLVEMENT OF UNDERWRITERS ON CLOSURE OF THE ISSUE, THE COMPANY SHALL FORTHWITH REFUND THE ENTIRE SUBSCRIPTION AMOUNT RECEIVED FOR THE DELAY BEYOND 78 DAYS. IF ANY IN REFUND OF SUCH SUBSCRIPTION, THE COMPANY SHALL PAY INTEREST AS PER SECTION 73 OF THE COMPANIES ACT, 1956

Universities as Institutions

An institution is not simply a social arrangement, but one which has a certain meaning for its members such that they acknowledge its moral claims on them and are willing to submit to its demands, at least some of the time, even when they find those demands to be contrary to their individual interests. By this test can universities in India today be called functioning institutions? **563**

Participatory Rural Appraisal

The popularity of techniques of participatory rural appraisal (PRA) in rural research and project planning comes in large part from their ability to generate information at the community level directly with members of the community. Such information is held to be more reliable, more efficiently obtained and more relevant to community interests than that generated by conventional social research methods. But while techniques of PRA offer new opportunities for the articulation of local knowledge, including perspectives of women and other subordinate sections of communities, they may also expose projects to new risks by creating public contexts and a new idiom in which dominant interests can gain legitimacy. The greatest danger, however, is the promotion of PRA as a 'quick' methodology of participation, rather than as a set of techniques or tools to be used in the context of project-specific strategies for participatory planning. **569**

VAT for India

A comprehensive value added tax (VAT) with consumption base, tax credit method and destination principle to determine VAT on international and inter-state trade flows can form an ideal commodity tax system for India. In a federal set-up it may be ideal to have state and central VATs substituting the current state and central taxes on goods and services. A VAT with one or two rates has to be supplemented by special excises and subsidies to deal with the problem of equity, environment and social preferences. **579**

Dollar in Disarray

In the wake of the recent panic, foreign exchange markets are looking for some beacon of hope and stability. But none is on the agenda and the universe of finance capital will continue to be one of chronic instability, fear, bankruptcies and massive job liquidations. The empire of the dollar and the financial galaxy in which it orbits are a ticking time-bomb. **554**

In the Dock

The findings of the review report on the Sardar Sarovar project and the MP government's decision to call a halt to the construction of the dam give credence to the arguments of the anti-dam movement **542**

Communalism in Kerala

By aligning with small splinter communal parties, the major political parties which could have played an important role in secularising the political process have become participants in communal processes in Kerala. **544**

Research on Research

An aspect of 'methodology' researchers rarely report on are the processes and procedures they have to use while conducting research and disseminating its results. The many hazards of conducting an unconventional but worthwhile research study. **556**

Amusing Times

While Zhirinovsky's visit was an amusing international event, providing some relief in the dismal times we live in, courtesy our new economic policies, amusement in our public life is not confined to the doings of a Zhirinovsky or a Seshan. **541**

India and Social Summit

The three core themes of the international summit on social development hosted by the UN in its 50th year were alleviation and reduction of poverty, generation of productive employment and enhancement of social integration. An Indian perspective on these aspects of social development. **548**

University Syllabi Censored

I WISH to bring it to the notice of *EPW* readers that, conniving with the communal forces, the government of Karnataka has recently withdrawn *Mahachaitra*, a Kannada play, from the syllabi of Gulbarga and Kuvempu universities.

Mahachaitra was written by H S Shiva Prakash 10 years ago and had won the state and central Sahitya Akademi awards. It was widely performed in various places in Karnataka over the years. It was prescribed as a textbook by Gulbarga and Kuvempu universities for first year BA students sometime ago.

The Lingayat seers of religious mutts 'discovered' suddenly in last September that *Mahachaitra* contains 'some objectionable portions' and some derogatory remarks against Basavanna, a social reformer, after 10 years of its circulation. Acting upon the request of the then Congress government, the Board of Studies (an academic body that decides matters of syllabi in universities) discussed the issue and decided to continue the textbook till the end of the academic year (1994-95).

After a few months, the communal/casteist forces woke up again. Recently, the Basava Dala, a Veerashaiva organisation, renewed its demand and set March 7 as the deadline for the withdrawal of the textbook. The issue took both caste and religious dimensions (as the religious seers belong to the dominant Lingayat caste in the state) when several Lingayat seers of religious mutts, including one Mathe Mahadevi, resorted to an indefinite hunger strike in Gulbarga and Bidar demanding immediate withdrawal of the textbook from the syllabi. The state government appointed a committee on March 6 to study the text and present a report within 15 days. In a surprise move, the state governor, the chancellor of the universities in the state, issued an order on March 9 asking Gulbarga and Kuvempu universities to withdraw the text from syllabi immediately just 15 days before the final examinations, leaving the students in a quandary.

The 'controversy' illustrates the fact that communal forces have gained strength over the years to such an extent that they could use the play as a pretext to whip up communal/casteist sentiments even after a long time of its publication. The Janata Dal government, known for its appeasement of communal forces - Muslims were forced to hoist the national flag at the Hubli-Idgah maidan in January this year under pressure of the Janata Dal government - has withdrawn the textbook not only to please the communal/casteist elements but also to

bag Lingayat votes in the zilla panchayat and taluk panchayat elections currently under way. It has been proved that the appointment of the expert committee was only an eyewash to buy time and make a pretence of democracy. By its unilateral decision, the state government has undermined the autonomy of academic bodies in framing their syllabi and actively connived with communal forces in communalisation of academic institutions by dividing the academic community on caste and religious lines. The claim of the communal forces that the 12th century social reformer portrayed in the play is a mythological figure must be understood as part of the larger politics of Hindutva that involves the historicisation of religious figures and mythologisation of historical figures. Basavanna was a secular social reformer who has fought caste and other kinds of oppression. He does not belong to any community.

In the context of the growing intolerance towards creative writing, I appeal to writers and intellectuals in the country to send protest letters/telegrams on the withdrawal of *Mahachaitra* from the university syllabi to the chief minister of Karnataka and demand immediate cancellation of the withdrawal of the play.

K SATYANARAYANA

Bangalore

Gujarat and Development

GUJARAT is one of the most developed states of India in terms of industrial and economic growth, having a very high per

capita income. In terms of capital income generated in the manufacturing sector, Gujarat now stands first in the country. Its urbanisation rate is much higher than that of most other states. It is one of the very few states where NRIs after the recent liberalisation and economic reforms are returning to set up industries and business. Moreover, Gujarat has evolved a pragmatic culture, has a multi-ethnic population, absorbing various traditions.

Yet, Gujarat lags behind in social development. Its rate of literacy is low, infant mortality is high, suicide rate among women is one of the highest in India, slums abound and the chart of economic and political crimes as also violence shows an upward trend. This clearly signifies that faster economic growth *per se* cannot enable the state to achieve high social welfare. Private enterprise and market planning, that work within the framework of the current institutions, at least, have no inherent tendency to bring about balanced growth, hence the failure to achieve social welfare.

In the absence of concern on the part of the politicians and bureaucrats, lack of equitable distribution of real incomes and failure to alleviate poverty and unemployment, such stark economic and social contrasts are unlikely to disappear over the foreseeable future.

Thus, while framing Gujarat's urbanisation policy the state and central governments and civic authorities need to be more 'responsible' for uplifting social welfare. Political will is a must for efficient management of civic affairs with existing resources.

Cynical Prescriptions

DESPITE the socialist rhetoric of the years of planning, the sharply dualistic character of Indian society reflected in varied forms of disparities (rural-urban, inter-regional and inter-state and above all inter-personal) not only persisted but got steadily accentuated. The accelerated economic growth of the 1980s did not make any significant difference and by the beginning of the 1990s it was clear that even the capitalist path of development that the Indian state had espoused required vastly greater emphasis on human capital and social infrastructure development. The economic reform measures under implementation for the last four years have been oblivious of the needs of social sector development and have widened inequalities in all spheres. The persistence of double-digit inflation, the sharp increase in the prices of the items of common consumption especially, has hurt the poor the hardest. The problem is compounded by the sluggish growth of employment and reduced societal support to improve educational and health standards and rural and urban amenities for the poor. Against the Eighth Plan goal of generating 32 to 36 million jobs in four years, the number of jobs created during this period would not exceed 21 to 22 million. And compared to the social sector expenditure target of 18.2 per cent of the Plan outlay, actual expenditure has been 15.5 to 16 per cent. The claims of higher allocations for IRDP, Jawahar Rozgar Yojana and Nehru Rozgar Yojana and such other special employment programmes notwithstanding, the amounts spent, families assisted and mandays of employment generated have all remained relatively modest compared to what had been achieved in the second half of the 1980s. The much-talked-about national renewal fund (NRF) has remained a facade for offering retirement benefits to the middle-level employees with the help of funds provided by the World Bank.

Despite several years of high agricultural growth, the terms of trade have been moved in favour of agriculture to benefit the surplus farmers and against the interests of the labouring classes in the rural and urban areas. The over-8 per cent growth of industry expected in 1994-95, though it appears broadbased, is led by automobiles and consumer durables. Some of the large increases, as in commercial vehicles and other capital goods, do little more than recover the ground lost in the first three years of reform marked by ruthless fiscal compression. The stimulus to growth in 1994-95 has emanated primarily from liquidity created by large portfolio investment by foreign institutional investors (FIIs) and the vast increases in consumption expenditure by the centre reflected in higher levels of revenue and gross fiscal deficits. The high inflation and the distorted pattern of industrial development are

obviously the result of such liquidity growth and rise in consumption expenditure. The rise in public consumption expenditure has been reinforced by burgeoning private consumption expenditure of the middle and upper classes, the rise in whose personal disposable incomes has been augmented by reductions in direct taxes and, more significantly, in customs and excise duties. The increase in consumption expenditure is reflected in the persistent drop in the rates of domestic saving and capital formation.

Finance minister Manmohan Singh's budget for 1995-96, his fifth in a row, has to be judged against these macro-economic distortions brought on by the new economic policies. The budget is obviously a cynical attempt to assuage the people's wrath, as reflected in the many electoral reverses suffered by the Congress, with long declamations on equity and poverty alleviation, anti-poverty programmes and schemes for scheduled castes and scheduled tribes, khadi and village industries, the handloom sector and small-scale industries, in preparation for the parliamentary elections of 1996. The whole manoeuvre is hypocritical because the perspectives which have guided the stabilisation and structural adjustment programmes remain firmly in place.

The finance minister has just stopped short of removing the 15 per cent surcharge on corporate taxation though he admitted after presenting the budget that he would have so much liked to do so as it was part of the government's tax reform commitment. The finance minister and other government spokesmen also admit in the same breath that many big companies pay no corporate tax at all due to the various concessions and that the overall incidence of company taxation is as low as 18 to 20 per cent against the nominal rate of 40 per cent plus 15 per cent surcharge. For the insurance sector, the government is content with the establishment of an independent regulatory authority for the present, but only because there is stiff opposition to the opening up of the sector to private and foreign capital. All the same, the budget speech is emphatic that the reform package has to be pursued with vigour. Barriers to further expansion of agriculture have to be identified and lifted; the public sector has to be revamped; industrial relations have to provide for greater flexibility in the deployment of labour; capital market reforms have to be widened and deepened; and insurance sector reforms have to be pursued with the aim of greatly widening access to insurance services and promoting competitive and efficient custom-oriented services. However, action in these directions has to wait until the next year's elections are out of the way. Hopefully, this cynical game will not succeed. Inflation, which concerns the common people most of all, is unlikely

to be controlled by reducing customs and excise duties on commodities of middle class consumption. The anti-poverty programmes are too meagre to have any significant impact on poverty. The resort to the banking system for the government's infrastructural projects will deprive many small-scale borrowers of bank credit. At the other end, the reduction in customs and excise duties is bound to further stimulate the consumption of the middle classes with adverse consequences for domestic saving and investment. Also, with the meagre central transfers to the states proposed in the budget, there can be little hope of any worthwhile improvement in social sector outlays.

The finance minister's argument that following the tenth Finance Commission's recommendations the flow of funds to the states would increase by 22 per cent from Rs 28,832 crore in 1994-95 to Rs 35,055 crore in 1995-96 is a piece of obfuscation. In the first place, among all the Finance Commissions so far the tenth Commission's recommendations (as accepted by the government) appear to have been the least generous towards the states. While it has recommended an increase in the states' share in the net proceeds of shareable union excise duties from 45 per cent to 47.5 per cent, it has also recommended a reduction in the states' share of taxes on income from 85 per cent to 77.5 per cent. True, non-plan grants, as per the tenth Finance Commission's recommendations, are higher by Rs 3,689 crore in 1995-96, but the centre has simultaneously reduced plan grants to states by Rs 2,478 crore. In the first year following the ninth Finance Commission's report, namely, 1990-91, there had been a 26.1 per cent rise in net resources transferred to state governments, whereas in the first year of the tenth Commission's dispensation the increase works out to just 5.2 per cent. Even if the unexpectedly large small saving collections transferred to the states in 1994-95 are excluded, the increase in resource transfers in 1995-96 does not exceed 12 to 13 per cent. The state's development expenditures, which were rising at the rate of 18 per cent per annum during 1985-86 to 1990-91, have thereafter risen by 13 per cent per annum during 1990-91 to 1994-95. If inflation rate differences are taken into account, the rate of increase in real development expenditure may have fallen dramatically from about 10 per cent to 2 per cent per annum between the two periods.

A major stratagem of the budget for 1995-96 is to pass on part of the burden of development in agriculture, tribal areas, khadi and village industries and handloom and small and tiny units to banks and concerned financial institutions. The government has proposed the setting up of a new rural infrastructural development fund in the NABARD for providing loans to state governments and state-owned corporations for completing ongoing projects relating to medium and minor irrigation, soil conservation, watershed management and

other forms of rural infrastructure. The fund would be created from out of the contribution of banks to the extent of their shortfall in achieving priority sector lending target for agriculture subject to a maximum of 1.5 per cent of a bank's net credit. In the first place, this should have been restricted to only those banks which do not have the necessary infrastructure in the form of rural or semi-urban branches to service agricultural loans in the initial period of their operations. For other banks, which constitute the bulk, priority sector lending cannot be substituted by finance for infrastructure lending, the two should be considered complementary. Admittedly there are large shortfalls in priority sector lending by banks – rough estimate of the annual shortfall in agricultural lending would be Rs 9,000 to Rs 10,000 crore – but they should have been prevented through rigorous performance criteria for the banks. Yet another question would be the rate at which the state governments would be lent money under the scheme. As there is state government guarantee for the loans so granted, the rate of interest (not revealed as yet) has to be moderate commensurate with the project profile of infrastructure development in agriculture. The proposals contained in the finance minister's budget speech for expanding institutional credit for khadi and village industries and for small-scale sectors do not address the problem of an acute reluctance on the part of scheduled commercial banks to lend in favour of the priority sectors, as a consequence of the financial sector reforms.

Yet another much-publicised budgetary programme relates to an increase in the centre's expenditure earmarked for the department of rural development. In the first place, the increase is meagre, from Rs 7,336.80 crore in 1994-85 (revised estimates) to Rs 7,718.06 crore or just by 5.2 per cent. Secondly targets have been slashed in physical terms: from 1,150 million mandays of employment to 917.23 million mandays under the Jawahar Rozgar Yojana, or from 23.5 lakh to 19.5 lakh of rural families below the poverty line to be assisted under the integrated rural development programme (IRDP). Five years ago in 1989-90, the target was to assist 29.11 lakh poor rural families under the IRDP.

This narrowing of targets could not have been otherwise, for the government has hardly mobilised any additional resources in proportion to the growth of GDP during the past five years or so. Gross tax revenues of the central government as percentage of GDP has declined by over a percentage point from 11.3 per cent in 1989-90 to about 9.90 per cent in 1995-96 (budget estimates). The claim that the reduced tax rates have brought in better tax compliance and additional tax revenues has to be accepted with a pinch of salt, for if the gross tax to GDP ratio for the central government had remained at 11.3 per cent which generally obtained in the second half of the 1980s, the absolute amount of additional revenue accruing to the government would have

been a whopping Rs 13,500 crore or more per year. In regard to higher collections under corporation and income taxes during 1994-95 in particular, the government's perception that reduced tax rates have brought about improved tax compliance can only be called a self-imposed deception. Higher corporation and income tax collections have come about because a large number of companies have garnered phenomenal amounts of other incomes and non-operating profits during 1993-94 and 1994-95; salaries of high income earners in the financial sector and even in manufacturing firms have shot up during the past two to three years at rates of increases far beyond the increases in GDP at current prices. Non-petroleum imports have risen by over 30 per cent in 1994-95 and hence a rise of about 19.2 per cent in customs revenue in the wake of reduced rates, cannot be said to be due to better tax compliance; likewise, the estimated rise of 16.4 per cent in union excise duties when large companies have generally been reporting even 25 per cent rise in sales turnover.

As a result of the reduced tax mobilisation in relation to increases in nominal GDP and the failure to contain non-development expenditure growth, the goal of achieving fiscal correction has remained a distant dream and the quality of fiscal adjustment made so far has been poor. Manmohan Singh has declared that large revenue deficit was a curse of the Indian fiscal system, but in his regime it has galloped from Rs 18,562 crore in 1990-91 to Rs 32,716 crore in 1993-94 to Rs 34,132 crore in 1994-95 and now finally to Rs 35,541 crore in 1994-95. Even the proposed decline in revenue deficit to GDP ratio from 3.8 per cent in 1994-95 to 3.4 per cent in 1995-96 after it had attained 4.2 per cent in 1993-94, may turn out to be only wishful thinking. For, the budget has not taken into account the possible *interim* relief that the government may have to confer in the wages and salaries of government employees which may be recommended by the fifth Pay Commission: (mindboggling expectations have been generated in the minds of the government employees in this respect) and the recommendations will coincide with the impending general elections. A 10 per cent rise in pay and allowances of central government establishments including defence personnel implies about Rs 2,300 crore of additional expenditure in a full year. Besides, the final expenditure figures always turn out to be higher than the budgeted amounts. In 1994-95, such excess rise was of the order of Rs 6,097 crore (excluding the increased small saving transfers), the bulk of it being under revenue expenditure. Some problems may also arise on the receipts side, particularly in capital receipts such as PSU equity disinvestments which is supposed to be stepped up from about Rs 2,800 crore in 1994-95 to Rs 7,000 crore in 1995-96. The resource requirements of public enterprise through bonds and debentures have also been raised from

Rs 7,234 crore in 1994-95 to Rs 8,354 crore in 1995-96. In 1994-95, the shortfalls in market and other long, medium and short-term borrowings and in disinvestment of equity holdings by the government was compensated for by the net accrual to the centre of Rs 4,351 crore (against the budgeted amount of Rs 848 crore) under small savings. The cost of borrowings would also be much higher during 1995-96 than in the previous year; the interest rates on government borrowings have been kept down during 1994-95 because the government has been able to mop up the surfeit of liquidity artificially created out of the portfolio capital inflow from abroad. The money market has already started experiencing stringency which is likely to persist during 1995-96. The provision of interest payments has been brought down as between the budget and revised estimates of 1994-95, from Rs 46,000 crore to Rs 44,000 crore or from 53.4 per cent of the centre's total revenue receipts to 49.5 per cent; in the budget for 1995-96, it has been pushed up again to Rs 52,000 crore or 51.5 per cent of revenue receipts. Overall, the government would be hard put to achieve even the moderate decline in revenue deficit to GDP ratio or to contain the gross fiscal deficit to GDP at 5.5 per cent. In any case, the government's resource requirements even at that level are sure to put tremendous pressure on the financial system and push up the interest rates to rather dramatically high levels as the year 1995-96 may not see the availability of high liquidity from external sources.

The centre's budget for 1995-96 is unlikely to contribute to any expansion in development activity because the total development expenditure consisting of non-plan development expenditure and plan expenditure would show an absolute reduction in nominal terms during the year. The total plan expenditure which went up by 13.8 per cent from Rs 42,855 crore during 1993-94 to Rs 48,761 crore during 1994-95 is expected to decline to Rs 48,500 crore in 1995-96. Non-plan development expenditure consisting of non-plan revenue expenditures for social and economic services and non-plan capital expenditure together would experience a fall from Rs 8,590 crore in 1994-95 to Rs 7,955 crore in 1995-96 after experiencing a rise of 5.2 per cent from Rs 7,521 crore in 1993-94. If industrial activity has revived during 1994-95, it is partly due to the fact that the centre's total capital expenditure, which experienced an erosion even in nominal terms between 1990-91 (Rs 31,782 crore) and 1992-93 (Rs 29,916 crore) and a modest recovery in 1993-94 (Rs 33,684 crore), has shown a sharp rise by 16.9 per cent to Rs 39,370 crore in 1994-95. In 1995-96, it is expected to register an absolute decline to Rs 35,823 crore, partly because the collections under small savings are expected to be lower. Aside from the sources of the expenditure shortfall, it is the perspective that is brought to bear on public expenditure

and its role in socio-economic development that is germane to the possible impact on economic activity. Domestic industrial activity will also be affected by indiscriminate reductions in import duties on machinery items, machine tools and parts and components to only 25 per cent. There are genuine fears amongst Indian industrialists that opening up of the capital goods market with such low protection rates may jeopardise their growth in the medium-term.

Finally, the government's hope of containing inflation within 7 to 8 per cent during 1995-96 appears somewhat far-fetched. The widely publicised aspect of the budgetary policy is the unduly low import duties on basic and intermediate goods and to reduce excise duties on items of middle class consumption like plastics, metals, glassware, aerated water, glazed tiles, cosmetics, perfumed antiseptic cream, polymer-based paints, audio and video magnetic tapes, dry cell batteries, parts of motor vehicles, etc. While prices of some of these items may come down initially the policy is unlikely to make a significant impact on the general price level, nor will the prices of mass consumption goods, which have experienced phenomenal increases in the recent period, fall. In these goods, the role of speculation and hoarding cannot be ignored. With the sizeable holding power of the rich farmers and traders, the decline in the rate of growth of money supply in the aggregate does not help to contain such hoarding and speculation unless the state is prepared to take administrative actions through vigorous implementation of the Essential Commodities Act and such other legal provisions. As it is, in the immediate period, monetary expansion cannot be arrested; for, the government is likely to pump in as much as Rs 8,000 crore through additional primary money creation during the month of March 1995 alone, which will have its secondary effects in the first half of 1995-96. Until early March the centre's budget has been in surplus to the extent of about Rs 2,000 crore and now the revised estimates place the budgetary deficit at Rs 6,000 crore for the whole of 1994-95.

Yet another source of inflation is the sizeable amount of fiscal deficit which, in the final analysis, is unlikely to be lower than about 6 per cent of GDP. Besides it is the current, unproductive or non-developmental expenditure which is a definitive source of inflation. While the total expenditure proposed in the centre's budget for 1995-96 would rise by 6.1 per cent from Rs 1,62,272 crore to Rs 1,72,151 crore, revenue expenditure would rise by 10.9 per cent from Rs 1,22,902 crore to Rs 1,36,328 crore, but capital expenditure would show an absolute decline by 9 per cent from Rs 39,370 crore to Rs 35,823 crore. In the meantime, if any interim relief as per the Pay Commission's recommendations are to be awarded the composition of expenditure would further deteriorate in favour of higher consumption expenditure.

MAHARASHTRA

Non-Congress, Non-Maratha

THE eighth assembly election in Maharashtra witnessed two records being set in the state's politics. First, the election saw the highest percentage of voter turnout since the formation of the state in 1960 and, second, for the first time a Congress government was voted out of power in the state.

In face of the severe beating the party is receiving in various states across the country, one expected serious introspection from the Maharashtra Congress leadership. Instead it has been dishing out platitudinous explanations for its defeat. Shivajirao Deshmukh, the MPCC chief, called the verdict a 'temporary setback' to the Congress, taking false solace in the golden past of a now highly factionalised and crisis-ridden party. As the results were being declared, the Congress prided itself on emerging as the single largest party and for some time even toyed with the idea of making a bid to form the government. But realising that it would be too much of an exercise roping in all the victorious party rebels, the leadership made a show of bowing to the mandate and allowing the BJP-SS combine to form the government. A Marathi newspaper editorial even praised the Congress decision when, in fact, the issue was one of straightforward admission of defeat.

The reasons for the Congress defeat are various: the Bombay riots, the Muslim alienation due to the misuse of TADA in the wake of the bomb blasts, Khairnar's allegations against Sharad Pawar of corruption and links with the underworld, the Jalgaon sex scandal and, to top everything, the death of 113 Gowaris in a stampede in Nagpur. These incidents dwarfed whatever gains the Sharad Pawar government could boast of: the claim of promises of Rs 1,00,000 crore of foreign investment in the state and a state-initiated women's policy. That the Congress aimed to project economic liberalisation as the main plank of its electoral campaign became evident when it invited Manmohan Singh to flag off its campaign. Pawar, too, during his tours of the state, kept harping on 'aggressive industrialisation' as the top priority of his would-be government. But little did the party realise that the one-point programme of economic liberalisation holds little attraction for the majority of the state's population.

The internal feuds in the Congress over ticket distribution also seems to have gravely affected the Congress electoral prospects. In the earlier election there had been Congress rebel candidates in a few pockets of Vidarbha and Marathawada. On this occasion, the phenomenon spread to some 200 seats all over the state. Significantly, the rebels dealt a major blow to the party in south Maharashtra, normally known to be the bastion of the Congress. This time only 36 out of 75 official Congress candidates in

South Maharashtra got elected while 18 out of 54 rebel candidates registered victories.

The disillusionment with the Congress government was exploited to the full by the BJP-SS combine. It is said that the combine won 35 per cent of the votes, a notable improvement over its previous tally of 26 per cent. Manohar Joshi has been made the chief minister keeping in mind his business contacts and it is possible that Maharashtra may see for the first time a predominantly non-Maratha cabinet governing the state. Sensing the importance of its victory, the BJP-SS combine is all set to demonstrate that a non-Congress government can rule the state for the full term of five years. Yet, given the differing views held by BJP and Shiv Sena on major issues like statehood for Vidarbha and renaming of Marathwada University and also given the uncompromising style of functioning of Shiv Sena leader Bal Thackeray, it will be a tightrope walk for the coalition government.

THE ECONOMY

Distorted Outlook

THE government of India's *Economic Survey* for 1994-95 provides a clear testimony that the finance ministry's many proposals for persisting with economic reform measures through the central government budget for 1995-96 have been shot down by the political leadership in the context of the series of state-level election reverses for the ruling party, the intra-party bickerings and the impending general elections in 1996. If the *Economic Survey* is to be believed, the recent budget ought to have persevered with the reform agenda in all spheres.

Arguing that there is always the temptation of fiscal laxity for short-term gains, the *Survey* warns: "But history teaches that the costs of fiscal populism can be extraordinarily high and long-lasting". According to it, if fiscal deficit continues to be high, the growth in private investment could be throttled by rising interest rates; all reforms in the fiscal area including reductions in marginal direct tax rates and the reform of the structure of the central excise and customs duties, have to be persevered with till completion. The process of eliminating licensing as a method of controlling imports should be extended further, "including in the area of consumer goods"; the fear that there will be an unsustainable upsurge in consumer goods imports is unwarranted, since tariffs and exchange rate management would prevent such an outcome. With a view to phasing out unnecessary legal and bureaucratic impediments, the Urban Ceiling Act, the Companies Act and the Sick Industries Act need to be reformed so that speedy restructuring, acquisitions and mergers take place as tools needed for meeting the challenge of competition. Reform of labour laws is equally important as is improved regulation of equity markets, banks, insurance and debt markets. On the insurance sector, "the views of the government on the recommendations of the (Malhotra) Committee have been

crystallised and a decision on major policy changes, including allowing entry of private insurance companies into the industry, is at an advanced stage of formulation". Amongst the constraints that exporters face, the labour policy for exporters is more adverse than in competitor countries, inhibiting flexibility and responsiveness to world markets. Many exportable goods are still subject to small industry reservations, which inhibit growth and quality exports. India should take advantage of the vast new opportunities opened up in world trade in agriculture as a result of the Uruguay Round of multilateral trade agreements. For the improved availability of good quality infrastructure, especially power, roads, water and telecommunications, the policy of opening up to private investment and even private management and operation should be given further impetus and the user services have to be paid for with subsidies drastically reduced.

While these and many other aspects of individual policies may have some rationale at the micro-level, the *Survey* is on the whole impervious to the adverse repercussions of the new economic policies. The previous three *Economic Surveys* talked of *nauseum* of economic reforms with a human face; there is hardly any mention of it in the latest document. Clearly if the mass of people have to benefit from reforms, India has to address the question of the acute social backwardness as reflected in poor health services, high level of illiteracy particularly among women and the growing inadequacy of rural and urban infrastructure. This is necessary not only for tackling the fundamental issue of poverty but also for two other reasons: first, the poor cannot partake the benefits of development in a competitive environment and widely participatory economic growth is not possible unless their skill levels are better than what they are at present; and secondly, poor health and literacy standards will serve as serious constraints on expanding productivity and efficiency at the plant level including the achievement of better quality products for exports. It is not that the *Economic Survey* is silent on the social sector issues, but the perspective brought to bear on these issues is flawed. The question of social sectors and the poor is treated as a residual issue and not as a precondition for healthy economic growth and an integral part of the development strategy. Stray data on improvement in real wages of unskilled agricultural labour and estimates of additional employment do not disprove the fact that the vast masses of the poor are not the beneficiaries of the exotic economic development which the new economic policy is bringing about. The improvement in real agricultural wages during 1992-93 and 1993-94 was essentially attributable to a quantum jump in foodgrains output and stability in food prices; as were the estimated improvements in employment. The fact is that the persistent decline in public investment in agriculture has hurt the production potential of the economy. The *Economic Survey* also argues that resources for public investment can only become avail-

able if subsidies on agricultural inputs such as irrigation and fertilisers can be scaled down.

The *Survey* repeatedly points out that the country should attain the standards attained by our competitor countries in Asia, that the custom duty rates must become comparable with those in other parts of Asia, that the labour policy should be made flexible so that it does not become more adverse than in competitor countries. In this regard, the whole body of research knowledge now coming out even from the World Bank and other multilateral agencies is illuminating. The following extracts from a World Bank's Operations Evaluation Study (1992) on industrialisation in Korea, India and Indonesia should be an eye-opener:

From 1963, it [Korea] switched to a primarily export-oriented strategy, proving strong incentives and support for exports while pursuing import-substitution in a range of new, increasingly complex, industries. Its drive into these new industries, while largely in the private sector, was strongly directed by the government. Its policies to this end included high and variable rates of effective protection, central allocation of credit, a deliberate policy to create large conglomerate enterprises, minimal reliance on foreign direct investment and close co-ordination by the government on the pace and direction of industrial development. It is generally agreed that the government's interventions played a central role in guiding, shaping and promoting Korea's industrial development.

The drive was supported by a rapid build-up of skills at all levels and by extensive development of the science and technology infrastructure. Interventions in the technology markets were designed to strengthen local absorptive and later innovative capabilities. Unlike most 'classic' import-substituting regimes, however, Korea applied protection selectively, encouraged domestic competition, and forced early entry into export markets. It maintained a distinction between a relatively mature, competitive sector, which operated in export markets under near free trade conditions, and a set of new activities that were more highly protected, undergoing "learning", and aimed primarily and initially at domestic markets.

The evaluation study further argued that the World Bank's macro perspective and general economic stance were badly biased in line with liberal views on trade strategy and undesirability of government interventions, whereas its project work in Korea showed a much clearer appreciation of capability building selectivity and institutional promotion; the project reports were more structuralist and favourable to interventions. "The restrictive framework underlying the Bank's analysis of industrialisation has led it to underplay and overlook the micro-level process of capability acquisition which underpins industrial success". Almost all of the East Asian economies observed such selective interventions in the form of mild repression of interest rates, directed credit, selective industrial promotion and technological adaption, import-substitution, and

trade policies that pushed manufactured exports. It is time Manmohan Singh and his team of experts in the finance ministry take a lesson or two from these experiences.

PANCHAYATS

The Dark Side

DECENTRALISATION of power through panchayats – with the professed aim of democratising rural society – may quite often subvert the objective, given the continuing socio-cultural hegemony of the conservative forces in the panchayats. A recent report from Rajasthan should be an eye-opener. Newly elected sarpanches of 38 gram panchayats in Bassi block of Jaipur district have unanimously passed a resolution condemning, and deciding to boycott, the 'saathins' (women community workers for social change), who in Rajasthan had been working especially to bring about an end to the widespread system of child-marriage in the state.

Incidentally, it was in a village in this same Bassi block that a saathin, Bhawari Devi, was gang-raped last year by local goons, because she tried to prevent the marriage of a child in the village. The guilty are still at large and the local administration remains an impotent spectator. In fact, the meeting of the sarpanches which decided to boycott the saathins was convened by the block development officer of Bassi and was also attended by the local MLA. The sarpanches blamed the saathins for bringing a bad name to the village community by spreading the 'story' of the gang rape. Eventually, the will of the democratically(?) elected sarpanches prevailed over the administrative decision to assign a role to village women community workers in the reform programme to stop child marriages.

The Bassi panchayat decision is not an isolated instance of patriarchal hegemony that prevails in most parts of the countryside, particularly in the Hindi-speaking heartland. Lynching of young men and women for daring to marry outside their caste groups among the caste Hindu and scheduled caste communities, burning of so-called witches among the tribals in eastern India, persecution of women on charges of adultery among Muslims are fairly common in our villages. They are all perpetrated with popular sanction, either in the form of the traditional village assembly of arbitrators or that of the modern elected panchayats. The lowest and vilest alleys in our metropolises may not present a more dreadful record of crime against women than does the smiling and peaceful countryside in India. The newspapers provide a daily calendar of the deeds of hellish cruelty and hidden wickedness that go on in the villages, year in, year out. In these circumstances, the 73rd constitutional amendment, and the provision for reserving one-third of panchayat seats for women in order to empower rural women, may turn out to be a non-starter at the ground level. As long as sarpanches of the Bassi type continue to dominate the panchayats, the

women members – constituting only one-third of the sarpanches – will be bypassed, or even harassed, if they dare to oppose the male patriarchs of their villages.

It is evident that altruistic legislative measures from above can never empower the poor and the disadvantaged groups. The need for the growth of critical awareness among the rural poor through political and other forms of mass mobilisation had been ignored for decades. Barring the frequent electoral campaigns, the rural masses in the Hindi heartland have hardly a chance to exercise their discerning faculties in the face of the challenge of changing realities. Even in such electoral participation – as well as in the only movements that the villagers of this area had been involved during the last decade or so – they had been manipulated by political power-brokers into casteist and communal confrontations. This had only helped the reinforcement of conservative and patriarchal norms in the respective societies of the various religious and caste groups. The creation of a basis for the much needed social changes in the Hindi heartland depends in a large measure on the development of a political movement there that can displace the conservative, divisive and patriarchal norms that prevail in village society, and their champions who rule that society, by a new set of egalitarian and democratic norms and their representatives who need to emerge from within that society.

PHARMACEUTICALS

On the Political Agenda

REGARDLESS of what went before and what will come after, the formulation of a rational drug policy by the BJP government in Delhi is to be welcomed. That the policy goes beyond mere rhetoric is evidenced by the fact that the government has taken steps to work out and publish an essential drug list comprising 275 generic formulations for mandatory use in all government hospitals and health centres in the region. From what is known about the policy its main features are: ensuring the availability of safe and effective drugs at all hospitals and health centres; putting in place a good quality control and assurance system; improving procurement, storage and distribution of drugs; encouraging rational prescribing of medicines; promoting the use of generic names instead of brand names; strengthening the health education programme and promoting research on all aspects of drug use. The publication of the essential drug list is a first step towards achieving these goals. The list was constituted by a nine-member committee headed by a retired union health secretary, C R Vaidyanathan and includes Ranjit Roy Chowdhury, emeritus professor at the National Institute of Immunology and UNESCO professor of rational use of Drugs, Bangkok, who is credited with drafting the list. The drafting committee is now acting as a special purchase committee, until an independent one is constituted. Going one step further, the government is

constituting a state drug authority and has instituted a base-line survey on drug quality and usage in Delhi's public health institutions, so that the impact of the new drug policy may be assessed at a later date.

Interestingly, the BJP has not been among the most vocal critiques of the centre's attempts at foisting a pro-industry drug policy on the people, nor has it made rational therapeutics or a people-oriented drug policy a consistent agenda. Why then should it be so keen on promoting a rational drug policy? Certainly, it is not a populist measure, given that the changes underway, if the policy is implemented in full, will be difficult to reverse – an essential drug list and changed prescription practices go a long way towards educating doctors (and patients), notwithstanding the fact there is bound to be laxity and corruption all down the ranks. Drug consumer activists have found that practising doctors are often ignorant of the concept of an essential drug list and how to use it for ethical prescribing. Even with the unethical marketing practices that drug companies will no doubt resort to there is an even chance that doctors will find it easier and more satisfying (in terms of patient response) to prescribe essential generic drugs, even if the policy is shelved later on.

The policy is meant to be, and is, however, a visible demonstration of the people-oriented concerns of the new government, adds immensely to its credibility and in its implementation, to its administrative capability. It is hardly necessary here to mention that Delhi has one of the worst administered public health systems with an appallingly high number of unhygienic and insanitary institutions, high levels of corruption and unethical medical practices. It also has a Nursing Homes Act which is extremely poorly administered with few norms on minimum required conditions, etc. even formulated. It should be noted, however, that the Delhi drug policy does not interfere with the production end of pharmaceuticals – in any case, drug production is largely concentrated in the western region. Moreover, from what is known of the policy, no guidelines have been drawn up on items such as strictly implementing the Drugs and Cosmetics Act in respect of advertisements, promotion and marketing of drugs, etc. For example, there is considerable scope for drug companies to introduce new alternatives in the range of drugs which are to be bought and prescribed at the discretion of the individual hospital authority.

The test of BJP's sincerity about a people-oriented drug (and health?) policy would be its actions in Maharashtra, which is likely to have a BJP health minister and in Gujarat, two states where the pharmaceutical industry is well-entrenched. Nevertheless, even if the party were to ignore such 'peripheral' issues in these two states, the extensive and intensive work of the drug consumer movement – which incidentally finds no mention in the Delhi health minister's official pronouncements – must be given credit for putting drugs-for-the-people on the political agenda.

CURRENT STATISTICS

EPW Research Foundation

Subsequent to dispensing with the industrial licensing system, investment proposed as per industrial entrepreneurs' memoranda (IEM) filed with the industry ministry has aggregated Rs 3,44,930 crore with a claimed employment potential of 3.22 million. Industrywise, foodstuffs, chemicals, textiles and metals account for 72 per cent of the aggregate investment proposed. As in the case of FDI flows, investment under IEM is acutely concentrated in a few states with Maharashtra and Gujarat attracting about 37 per cent of the proposed investment; other states getting sizeable shares are UP (11.2 per cent), MP (9.9 per cent), AP (7.6 per cent) and Tamil Nadu (5.3 per cent). West Bengal (2.6 per cent), Bihar (1.2 per cent) and Karnataka (4 per cent) get relatively meagre proportions.

MADRAS CEMENT

Expansion Projects

MADRAS CEMENT (MCL), the flagship company of the Madras-based Ramco group, is the fourth largest cement manufacturer in the south. Even though the cement industry faced a recession in 1992-93 MCL was not very badly hit by it. The company has showed improved performance in 1993-94, with net sales going up by 18 per cent (Rs 36.87 crore), operating profit by 18 per cent (Rs 8.44 crore) and net profit by 10 per cent (Rs 1.97 crore). Depreciation and interest charges were up by 36 per cent (Rs 4.61 crore) and 21 per cent (Rs 6.58 crore), respectively. Non-operating profit increased by Rs 35 lakh while other income rose by Rs 123 lakh. Imports fell by 42 per cent (Rs 1.24 crore) while exports were up by 25 per cent (Rs 4.64 crore). A dividend of 51 per cent was announced for the year as against 45 per cent in the previous year.

Debt-equity ratio declined from 120 per cent in 1991-92 to 117 per cent in 1992-93 and 76 per cent in 1993-94. Short-term bank borrowings to inventories increased by 6 percentage points in 1992-93 and by 11 percentage points in 1993-94. Sales to total assets fluctuated at 120 per cent in 1991-92, 100 per cent in 1992-93 and 112 per cent in 1993-94. Sales to gross fixed assets too fluctuated at 113 per cent, 96 per cent and 101 per cent in the same period. Sundry creditors to current assets increased from 18 per cent in 1991-92 to 26 per cent in 1992-93 and 32 per cent in 1993-94. Exports to sales increased from 8 per cent in 1992-93 to 9 per cent in 1993-94. Growth in inventories declined sharply in the past three years. Return on investment fluctuated at 22 per cent in 1991-92, 15 per cent in 1992-93 and 17 per cent in 1993-94. Raw materials consumed to value of production after being steady at 10 per cent during 1991-93, declined to 9 per cent in 1993-94. Earning per share fluctuated at Rs 64 in 1991-92, Rs 27 in 1992-93 and Rs 30 in 1993-94. Remuneration to employees fluctuated at 11 per cent in 1991-92, 16 per cent in 1992-93 and 15 per cent in 1993-94.

The company has undertaken major expansion plans. It already has one unit in Tamil Nadu and another in Andhra Pradesh. It plans to set up its third cement unit at Trichy in Tamil Nadu, with a capacity of 6 lakh tonnes per year at a cost of Rs 150-200 crore. Other plans are a new spinning unit to emphasise its presence in the textile sector; expansion of the Andhra Pradesh cement unit by 1 lakh tpa; a 5 lakh tpa grinding unit for the Visakhapatnam steel plant and installation of DG sets at all the cement plants to ensure reliable supply of

power. MCL also plans to set up a cement grinding unit in Sri Lanka with an annual capacity of 5,50,000 tonnes.

Andhra Pradesh has witnessed the mushrooming of mini cement plants which enjoy sales and excise tax benefits. This enables them to sell their output cheaply, but the company's Ramco brand name commands a premium in the market. The company claims that its hi-tech process gives it a lower power cost per tonne of cement.

The company invested Rs 12 lakh on R and D in 1993-94.

VIKRANT TYRES

Rise in Costs

Vikrant Tyres has been in loss for two years now. The company incurred a loss of Rs 6.37 crore in 1992-93. In 1993-94, the company has again incurred a loss of Rs 3.6 crore. Net sales were up by 11 per cent (Rs 26.39 crore) and operating profit by 6 per cent (Rs 1.34 crore). Fall in depreciation by 39 per cent (Rs 3.13 crore) more than compensated for the rise in interest charges by 9 per cent (Rs 1.73 crore). Other income decreased by 5 per cent (Rs 18 lakh) while non-operating surplus increased by Rs 3 lakh. Gross profit fell by 23 per cent. Poor capacity utilisation of radial plant, where production was suspended for four months, reduction in advance licence benefits, increase in power tariff and other input costs coupled with higher incentives given to dealers due to market recession and increase in term loan interest burden contributed to the net loss. Exports for the year were up 15 per cent and imports by 59 per cent. The company added 14 more countries to its list for export destinations, thus taking the total to 51. The company exported 30 per cent of truck tyres produced during the year. It occupies the third position in the industry in terms of percentage of truck tyres exported to production. The company has been granted export house status.

Remuneration to employees has been steady at 48 per cent for the past two years. Net value added to value of production fell by 5 percentage points in 1992-93 and rose by 1 percentage point in 1993-94. Return on investment fell sharply in the past two years. Exports to sales have been steady at 19 per cent in the past two years. Sundry creditors to current assets increased from 19 per cent in 1991-92 to 20 per cent in 1992-93 and 33 per cent in 1993-94. Sales to total assets fluctuated at 105 per cent in 1991-92, 111 per cent in 1992-93 and 108 per cent in 1993-94. Growth in inventories declined by 18 percentage points in the year. Inventories to sales fluctuated at 18 per cent in 1991-92, 23 per cent in 1992-93, and 22 per cent in 1993-94. Sales to gross fixed

assets, after being steady at 155 per cent during 1991-93, rose by 16 percentage points in the year. Short-term bank borrowings to inventories declined by 1 percentage point in 1992-93 and then rose by 10 percentage points in 1993-94. Debt-equity ratio was steady at 187 per cent during 1991-93 and rose to 221 per cent in 1993-94.

The company has taken steps to reduce power consumption. An expenditure of Rs 50 lakh was incurred on R and D activities. Expansion in the radial truck tyres range for export and designing of new patterns for existing sizes of tyres are some of the department's activities.

INDO RAMA SYNTHETICS

Polyester Project

Belonging to the Indo Rama group, Indo Rama Synthetics has done well in 1993-94. Net sales were up by 10 per cent (Rs 12.45 crore), operating profit by 12 per cent (Rs 3.73 crore) and net profit by 100 per cent (Rs 10.76 crore). A decline in interest charges and depreciation by 27 per cent (Rs 3.08 crore) and 13 per cent (Rs 1.02 crore), respectively and increase in other income by 49 per cent (Rs 89 lakh) and non-operating surplus by 380 per cent (Rs 2.93 crore) helped in keeping margins high. An enhanced dividend of 26 per cent was declared for the year. Exports grew by 9 per cent (Rs 5.85 crore) while imports were up by 703 per cent (Rs 86.95 crore).

Debt-equity ratio fluctuated at 183 per cent in 1991-92, 137 per cent in 1992-93 and 234 per cent in 1993-94. Sundry creditors to current assets was steady at 12 per cent. Sales to total assets fluctuated at 62 per cent in 1991-92, 83 per cent in 1992-93 and 30 per cent in 1993-94. Sales to gross fixed assets too fluctuated from 90 per cent, 109 per cent and 45 per cent in the same period. Inventories to sales fell by 21 percentage points in 1992-93 and then rose by 24 percentage points. Raw materials consumed to value of production increased from 51 per cent in 1991-92 to 52 per cent in 1992-93 and 55 per cent in 1993-94. Return on investment rose by 1 percentage point in 1992-93 and then fell by 6 percentage points in 1993-94. Earning per share was steady at Rs 4 during 1991-93 and then rose to Rs 6 in 1993-94. Net value added to value of production fell by 3 percentage points in 1992-93 and has now risen by as much in 1993-94. Remuneration to employees was steady at 4 per cent for two years and rose by 1 percentage points in 1993-94.

The blended spun yarn plant at Nagpur began commercial production in January 1994 and achieved 1,273 MT of production. A major polyester project is coming up at Nagpur to produce partially oriented yarn

(POY), polyester staple fibre (PSF) and draw texturised yarn (DTY). Technology for the POY and polycondensation unit has been acquired from Du Pont of the US and for the PSF unit from Toyobo of Japan. The plant is equipped to produce 42,000 mtpa of POY and 25,000 mtpa of PSF. A spinning unit with a capacity of 59,184 spindles built alongside has commenced commercial production. The completion of the project will make the company the second largest producer of PSF and POY in the country. The PSF will be further processed to make spun blended yarn. Indo Rama expects this kind of vertical integration to help it achieve economies of scale and export targets. The proposed expansion plan would cost around Rs 10 billion. To part finance this the company plans to launch an Euro issue of \$ 75 million.

The company's R & D department installed Zweigle yarn hairiness testing instrument which is used to determine the number of protruding fibres in a particular length of yarn to improve the quality of spun yarn. Also an on-line production and quality monitoring system was installed which helped in quality improvement of yarn.

MAHAVIR SPINNING

New Ventures

Mahavir Spinning Mills, a subsidiary of the 621 crore Vardhaman group, is a leading manufacturer of cotton and blended yarns, sewing threads and mild steel billets and has shown improved performance in 1993-94. Net sales were up by 11 per cent, operating profit by 34 per cent and net profit by 66 per cent. Other income and non-operating profit were up by Rs 53 lakh (26 per cent) and Rs 1.07 crore (53 per cent). Taxation was up by 61 per cent, depreciation by 8 per cent and interest charges by 1 per cent. But for these hikes, margins would have been even higher. A dividend of 40 per cent was declared for the year against 37 per cent in the previous year. Exports were up by 11 per cent, while imports fell by 43 per cent. Export to sales ratio has been steady at 11 per cent in the past two years. The export performance was achieved by the company's 100 per cent EOUs. The company expects the performance to improve with the commissioning of the second unit and expansion plan at Malerkotla.

Earning per share fluctuated at Rs 29 in 1991-92, Rs 26 in 1992-93 and Rs 35 in 1993-94. Growth in inventories declined by 1 percentage point. Gross savings to gross capital formation was up by 17 percentage points. Net value added to value of production dropped by 3 percentage points in 1992-93 and then increased by 5 percentage points in 1993-94. Debt-equity ratio fluctuated at 74 per cent in 1991-92, 58 per cent in 1992-93 and 68 per cent in 1993-94. Sales to total assets fell from 100 per cent in 1991-92 to

97 per cent in 1992-93 and 90 per cent in 1993-94. Return on investment fell by 5 percentage points in 1992-93 and then rose by 4 percentage points in 1993-94. Remuneration to employees to gross value added fluctuated at 19 per cent in 1991-92, 21 per cent in 1992-93 and 18 per cent in 1993-94. Raw materials consumed to value of production fell from 46 per cent in 1991-92 to 45 per cent in 1992-93 and 40 per cent in 1993-94. Sundry creditors to current assets showed sharp fluctuations. It rose by 6 percentage points in 1992-93 and fell by 9 percentage points in 1993-94. Short-term bank borrowings to inventories rose by 19 percentage points in 1992-93.

The company has major expansion-cum-modernisation plans with focus on high value added products, modernisation and upgradation of product quality and service, material integration, import of technology and strategic alliances to enhance capacities through joint ventures. The company plans to set up a gassed and mercerised yarn project at Hoshiarpur with an initial installed capacity of 3.5 tpd, with an outlay of Rs 50 crore. For this the company has tied up with a Korean firm. The products to be manufactured include value added textile yarns for production of high quality fabrics. Another expansion scheme at its existing spinning unit at Malerkotla includes addition of 34,416 spindles to cater to the yarn requirements of the gassed and mercerised yarn project and other projects of group companies. The total cost of the project is estimated at Rs 65 crore. To meet the requirement of customers for a complete package of sewing thread products, the company has entered into a joint venture, Babour Vardhaman Threads, with Babour Campbell group of Ireland. The company has secured rights to market the products in countries like Nepal, Bangladesh and Pakistan.

The company proposes to make a 1:1 bonus issue. It has been also given permission to make Euro issues worth \$ 100 million.

DABUR (INDIA)

Rise in Sales

Dabur (India) is an 110-year old group with a turnover of approximately Rs 400 crore. It has a profile of 450 products, 22 of which contribute 70 per cent of the company's turnover. The company has six divisions handling different product ranges - health care products, family products, natural gums, exports, pharmaceuticals and the veterinary products.

Net sales went up by 24 per cent (Rs 60.58 crore) operating profit by 31 per cent (Rs 9.74 crore) and net profit by 37 per cent (Rs 3.85 crore). Taxation was up by 44 per cent (Rs 2 crore), depreciation by 32 per cent (Rs 1.39 crore) and interest charges by 19 per cent (Rs 2.46 crore). Non-operating profit fell by 16 per cent (Rs 4 lakh) while other income

was down by 84 per cent (Rs 3.62 crore). A dividend of 20 per cent was declared for the year.

Exports were up by 86 per cent for the year. New markets were established in Hungary, Bulgaria, Slovenia, Ukraine, Italy, Spain and Malta. The consumer range has been extended by well accepted international range of luxury soaps and talcum powder. The company has plans to introduce a variety of new consumer products like herbal soaps, talcum powder, sandalwood and lavender and vinegar in different flavours. As for its overseas plans, the company has applied to the Pakistan Investment Board for setting up a manufacturing unit, it has received approval from the Egyptian government for setting up a joint venture unit, Dabur Egypt, which is under incorporation. It already has a subsidiary in Nepal and a wholly owned subsidiary has been promoted by the company in British Virgin Islands. Exports to sales ratio increased by 3 percentage points in 1993-94.

Inventories grew by 10 percentage points in 1993-94 and fell by 81 percentage points in 1992-93. Return on investment was steady for two years at 11 per cent (1991-93) and then fell to 9 per cent in 1993-94. Raw materials consumed to value of production declined from 22 per cent in 1991-92 to 18 per cent in 1992-93 and 17 per cent in 1993-94. Earning per share fluctuated at Rs 18 in 1991-92, Rs 22 in 1992-93 and Rs 5 in 1993-94. Remuneration to employees declined from 25 per cent in 1991-92 to 24 per cent in 1992-93 and 21 per cent in 1993-94, while remuneration to employees to value of production was steady at 3 per cent for all the three years. Debt-equity ratio fell from 61 per cent in 1991-92 to 53 per cent in 1993-93 and 44 per cent in 1993-94. Sundry creditors to current assets has been steady at 5 per cent in the past two years after falling by 3 percentage points in 1992-93. Short-term bank borrowings to inventories fell from 85 per cent in 1991-92 to 76 per cent in 1992-93 and 72 per cent in 1993-94.

As a part of its modernisation and expansion plans the company's bulk drugs and chemicals unit was expanded. The company plans to launch new product ranges like dental care, soaps and shampoos to strengthen its position in the market. The company has entered into joint venture agreements with Guldenhorst B V of Netherlands to manufacture and market various confectionery products. Another joint venture, Carbin India, was incorporated with its works in Himachal Pradesh and products are expected to be launched in 1994-95.

The company invested Rs 90 lakh on R and D. Research was directed towards pharmaceuticals, ayurvedic products, cosmetics, toiletries, food products, veterinary preparations and development of classical ayurvedic preparations.

Amusing Times for Once?

G P D

Zhirinovsky's three-day visit was one amusing international event to have taken place in India after a long time, providing some relief in the dismal times we are required to live in, courtesy our new economic policies. However, it would be to underestimate this country to suggest that amusement in our public life was limited to the doings of Zhirinovsky or T N Seshan.

INDIA has always been a land of exotica. The west has tended to view things Indian as a shade mysterious and at times as outright chaotic and unfathomable. There is one cinema handbook which has no entry on Indian cinema. The only entry there is Satyajit Ray and some Hindi movies are attributed to him. Considering the factual errors that our own film encyclopaedia has made, the American handbook can be forgiven. But in the case of the American handbook it is hardly an error. For the westerners all Indian languages must sound alike anyway. (Our editors have no such excuse.)

The land of the exotic is unfathomable, unreachable. It appeared as if this picture changed for a while when Zhirinovsky visited India. This ultra-nationalist Russian must trace his pedigree to Solzhenitsyn if he has read him. It was the Nobel Prize winning Russian author who produced the gospel of Russian nationalism in his speeches at New York which are available in book form. If one read that book, one would tend to think of Stalin in rather warm and friendly terms. Zhirinovsky has, of course, gone several steps beyond. In the end he has become exotica of a kind. Russian exotica visiting the land of the exotica, in a manner of speaking.

The Russian found typical modern Indian exotica in the new middle class hero, T N Seshan. Zhirinovsky would like our chief election commissioner to go to Russia and conduct elections there. The CEC might agree if some film actresses, whom he admires, are also invited as deputy commissioners. Zhirinovsky however was not only looking for exotica. He probably understood how the media and the middle classes have valorised the man. He hoped to gain some mileage by making a special point about him. At any rate, that would make his subsequent statements about the partition of India sound credible. The man is committed to India and its people including the chief election commissioner. BJP leader Vajpayee's unrestrained delight at meeting this gentleman from the wild east

of Europe was indicative of what sort of heroes sell in India. T N Seshan is one. Zhirinovsky is another. One thinks that there was no proper electoral/democratic process in India till he came to power. The other thinks that there would be no proper democratic process in Russia till he comes to power and, the Russian orthodox church willing, he might actually do so. The three days of Zhirinovsky's visit was one amusing international event to have happened in India after a long time. Some relief in the dismal times we are required to live in presently, courtesy our new economic policies.

However, one would be underestimating this country if amusement in our public life was limited to the deeds of Zhirinovsky and T N Seshan. Our ministers do not want to pale into insignificance in comparison. As if the current exercises in semi-fascist humour of Zhirinovsky or the moral pretensions of T N Seshan were not enough, the minister of state for external affairs has offered to look after gurdwaras in Pakistan. There is nothing political in this offer, he reassured the government of Pakistan. The offer was of rather old vintage, made some years ago, and was entirely religious. Shrines belonging to minorities have fallen on bad times in Pakistan. This is true of Sikh gurdwaras and Hindu temples. The record of the government of Pakistan even before fundamentalism had become the dominant force that it is today was not particularly creditable. All this is true. But one would normally expect an Indian minister to be a little more modest

in these matters following the Ayodhya 'incident'. The offer came at a time when the VHP had announced its plans or intentions regarding the mosques in Banaras and Mathura. The minister was either unaware of this fact and had forgotten the story of the Babri masjid in Ayodhya or seemed to believe that the Pakistanis would not know of the new game plan of the VHP and would have forgotten about the Babri mosque.

People seem to be blissfully unaware of basic courtesies. The Pope was not courteous towards the Buddhists when he was visiting Sri Lanka very recently. The Pakistanis are either sorting out their ethnic problems through bullets and bombs or are busy reaching new heights of fundamentalist militancy. Our minister seems to be unaware that making a 'purely religious' offer of safeguarding minority shrines in neighbouring states can have dangerous implications. Imagine a situation when Pakistan offers to protect minority shrines in Ayodhya, Varanasi and Mathura. He might well have thought that such an absurd situation cannot arise here – because we have only 'disputed structures' and no shrines, really speaking.

You would agree that Indian politics can be an amusing game. Zhirinovsky's desire that T N Seshan should look after elections in Russia will never be fulfilled. R L Bhatia's purely religious offer to Pakistan would never be accepted. Even Shia and Sunni shrines are no longer safe in Karachi. The next step for our minister would be to suggest the protection of these shrines be handed over to India. A purely religious offer from a friendly neighbouring state can be made. One can only hope that the imagination of our folks in the south block does not run that wild.

But then amusement is amusement. It should not be taken seriously in Russia, India, Pakistan or anywhere else. For people burdened with inflation and poverty and globalisation, the only way to survive is to look upon such imaginative feats as amusing times for a change and to hope that nothing disastrous follows the indulgent amusement.

Re-opening Sardar Sarovar Issue

Significant Gain of Narmada Struggle

Sanjay Sangvai

The findings of the review report of the Sardar Sarovar Project and the Madhya Pradesh government's decision to call a halt to the dam construction in face of improper rehabilitation give credence to the anti-dam claims of the Narmada Bachao Andolan.

ON December 16, 1994, the twenty-five day-old indefinite fast by Medha Patkar, Seetarambhai and Kamlabehn of Narmada Bachao Andolan ended in Bhopal, after the declaration by the Madhya Pradesh chief minister that his state would call for immediate stoppage of the construction work on the controversial Sardar Sarovar dam if the tribals below the dam level of 80.03 metres are not resettled till December 31, 1994. He also declared, "since we are no more bound by the stipulations of Narmada Water Disputes Tribunal (NWDt) accord as per the order of Supreme Court, on December 13 we would press for further lower height." The chief minister announced that they would press for reconsideration on all issues and submit a separate affidavit in Supreme Court regarding stand of Madhya Pradesh. This is a significant victory of 10-year old struggle in Narmada valley. At last, the much awaited review report on the Sardar Sarovar project has seen the light of the day. The Supreme Court had ordered the report to be made public, and all the concerned state governments and the Narmada Control Authority (NCA) to respond to its recommendations within four weeks.

While issuing the order, the Supreme Court had made it clear that "the deliberations in the NCA have to be made on all aspects, uninhibited by any considerations of the legal implications thereof which if necessary, would be considered at the hearing of these matters by the court". This significant observation has unshackled the concerned states from 'restraints' by the stipulations of the NWDt award. The award has been used by the central and all the concerned state governments of Madhya Pradesh, Gujarat, Maharashtra and Rajasthan, as well as by the pro-dam individuals and organisations, to stall any questioning of the viability, feasibility and beneficiality of the dam, and its adverse impacts. Even when almost all the basic parameters, including the water availability in Narmada and the cost, seemed to be at variance, the NWDt award was projected as something sacrosanct with fervent orthodoxy.

POSITIVE DECISION

It is a positive feature that the Supreme Court, for the time being, has compelled the government to think about the basics of the project. We are not sure whether the court continues with the same attitude, as this order came at a time when petitions in the court could have become irrelevant. Though the Narmada Bachao Andolan (NBA) had filed the comprehensive petition calling in question the dam, its benefits and the socio-environmental destruction way back in May 1994, urging an immediate step by the court to prevent the illegal construction and submergence, the hearing has been delayed from time to time. On the other hand, the work on the dam was proceeding at full speed, threatening hundreds of families with submergence. But, the legal avenue remained defunct, thus *de facto*, allowing more and more injustice. Even now, though the court has ordered the review to be published, it has postponed the hearing of the interim petition for the immediate stoppage of the dam work, thus allowing the work to proceed up to 80.03 metres or even above it, making the increased submergence irreversible. The court should have avoided commenting on the non-violent method of the struggle. The court has termed the satyagraha and 'coming to the streets' as extra-constitutional. Are extra-judicial ways of protest necessarily 'extra-constitutional'? If the courts think so, this is a serious matter. Dharnas, morchas, satyagrahas, picketing, fasts are equally constitutional as is the judicial process. In fact, it is the failure of the judicial remedy which creates the need to sharpen other means of protest. Nevertheless, the recent decision of the Supreme Court has reopened the issue of SSP.

PROCEDURAL HASSLES

The Supreme Court has ordered the publishing of the review report of the review group appointed by the union water resources ministry on August 5, 1993. It was supposed to submit the report within three months. The review process of the Sardar Sarovar

has been one of the most tedious and frustrating experience. It took one year to complete and submit the report. At every stage the NBA and conscientious citizens of the country had to pressurise, confront and appeal the government and the members of the review group to get the review conducted, and the final report prepared. It is learnt that while the NBA took the matter seriously, a couple of members of the review committee treated the issue in utmost casual fashion, compelling the review group not to undertake the tour of the affected villages in the Narmada valley and of the resettlement sites. The secretary of water resource ministry, C D Thatte, stressed that the basic features of the dam are not amenable for any change. It was made clear that the group was merely to suggest ways and means to implement the project more efficiently. Still, all state governments, except Maharashtra and the NBA boycotted the review process.

The group seems to have accepted these unwarranted limits on its own scope, which ran contrary to the mandate it was given while it was constituted. The petition to challenge the review by some pro-dam people in Gujarat High Court in September 1993 and the undertaking by the union water resource ministry that the report would not be made public until the final order, was an alibi. There was no bar on completing and submitting the report but only on publishing it. But, the court case was made a pretext to drag on the completion of the report. There were attempts to have a consensus report to satisfy the powerholders. The chapters regarding benefits, environment and resettlement were diluted to the extreme and one member insisted on deleting the chapter on financial aspect of the dam if he was to sign the report. Even after signing of four members, the convenor of the group, Jayant Patil, a member of the Planning Commission, refused to sign and submit the report. At this point, two members of the group, L C Jain, an economist and a former member of the Planning Commission, and Ramaswamy Iyer, a former secretary to the union water resource ministry, sent letters to Patil, arguing that the delay in submission of the report, would amount to a breach of trust. Incidentally, this pressure was applied only after the NBA appealed to all the five members to submit the report. Ultimately, the report was submitted in July 1994.

The NBA has taken the matter to the Supreme Court. Already, a comprehensive petition challenging the claims of the dam and documenting violation of laws and human rights was filed in May 1994 in the apex court. A special leave petition (SLP) regarding the review report was filed and the two matters were clubbed together. After

much delay, the court opened the sealed envelope on November 15, 1994, asking the government to respond within four weeks. But, at the hearing on December 13 the court found the government response 'beautifully vague and non-committal' and ordered to respond till January 17. The court in its oral observations also expressed concern over the irreversible construction work and submergence.

The tedious process of the review would show that the powerholders in India are even averse to a small attempt to re-examine the issue, lest it may disprove their claim. At every stage of the review, the NBA had to fight a battle of nerves, but it did not allow the review process to be sabotaged half way. It kept patience and swallowed all privations because it was necessary to question the so-called 'public purpose' of SSP. The Sardar Sarovar review is a beginning of an attempt to refashion the notion of development policy. Despite severe constraints and limitations, right from the terms of references to the non-cooperation by the concerned governments, the review group has pointed out many shortcomings and flaws in the project, further confirming the seriousness of the issues which the NBA has been raising. The review group has mentioned that many important studies, action plans regarding the proposed benefits, hydrology, environmental aspects and about the rehabilitation aspects are still incomplete and unimplemented.

QUESTIONABLE CLAIMS

The report has doubted the government estimates of the water availability in Narmada and asked for a fresh estimate. The project authorities claim that the annual water yield in Narmada is 28 million acre feet (MAF) while number of engineers and the Madhya Pradesh government have claimed that the same is 23 MAF. The report suggests reordering of priorities of water allocations among different regions. The report heavily came down upon the proposed plan to grow sugarcane in early reaches of the Narmada canal, an issue which the NBA has been raising. It noted that the sugar factories are being given licence and it would be difficult to deny water for sugarcane once the cropping pattern gets established and vested interests develop.

While the report mentions that it has yet to scrutinise the command area studies, it nevertheless notes that the much talked about conjunctive use of surface water and groundwater is not an integral part of the SSP. The report makes clear that the irrigation coverage proposed for Kutch from SSP is very limited, and recommends an increase in allocation of water to Kutch and Saurashtra. And, if this is not techno-economically feasible, more attention should be paid to watershed management, tank irrigation and other traditional measures of water conservation. But, the actual outlay for these

measures in the Gujarat budget is very limited. Thus the review group has put forth an alternative approach towards water management and distribution, similar to the one envisaged in the SSP plan.

The report demands a detailed plan for providing drinking water, complete with financial scheme. It also asks the government to publish and disseminate a full list of 8,214 villages and 135 urban centres which are to be provided with drinking water facilities.

While dealing with the aspect of power generation, the review did not consider the impact of non-completion of the upstream Narmada Sagar Project (NSP) and the different estimates of water yield as important factors affecting power generation. It notes that for irrigation purposes the dam would require a height of only 436 feet, and an additional 19 feet for power generation. If this 19 feet of extra height is slashed, the adverse impact of SSP gets obviated to a large extent. Power benefits could be made up through alternative sources.

The report accepts the fact that the project was mandated and was ongoing, before the approval by the Planning Commission in 1988. The review feels there is still room for further studies and examination of impacts not earlier foreseen. Admitting that the notion of comprehensive, integrated planning and project formulation, fully incorporating human, social and environmental concerns right from the early stages, was a new idea, the report acknowledges that the full impact on downstream area, catchment area, and the flora fauna has yet to be made. It endorses the recommendations of the environmental subgroup of NCA and asks those in charge of the project and NCA not to regard the environmental point of view as external to the project continuation. Referring to the submission by the union ministry of environment and forest (MOEF), the review concluded that action plans are still incomplete. Many of the studies, plans and actions are behind schedule, and there have been considerable slippages in project construction. The review doubts the advisability of releasing the forest lands for compensatory afforestation.

REHABILITATION: FROM NUMBERS TO MASTER PLAN

On the human aspects of the project, the review observes that efforts must be made to count the human and social costs of the project, and its remedial measures. It asks for a complete census of groups, communities, and individuals to be affected in any manner whatsoever, so that the data base needed for planning is comprehensive. The report questions the sanity of secondary displacement caused by the resettlement on forest land which may further reduce the forest land and create problem in future.

The review accepts the fact that the land-based resettlement as per the order of the

NWDT may not be fully implementable. There have been slippages in the time schedule and non-observance of proper rehabilitation in advance of submergence needs to be avoided. The review calls for a re-examination of the concepts of resettlement and rehabilitation in the light of actual difficulties. In the end, the report notes the demand of the Madhya Pradesh government to lower the height of the dam to minimise the adverse effects.

Thus, it appears that the group has raised almost all the basic issues regarding the dam. All the major points raised by the NBA have been acknowledged. Nevertheless, on many points, the report justifies the premises of the project and even condones the non-observance of rules and laws. Though the Gujarat government and the dam-supporters like ARCH-Vahini snubbed the group, the group went out of its way to take cognisance of their point of view. The group refrains from commenting on the sorry state of rehabilitation. Nor does it seriously dwell upon the grave violation of human rights due to the continuous police repression in the Narmada valley. The review does not make any decisive comment about the dam. But it does raise significant doubts. It has done significant work by at least listing down the points which indicate that the project is mismanaged, confirming the issues raised by the NBA. Yet the review has refused to pursue its observations to its logical conclusion.

However, the Supreme Court seems to have taken the review report seriously and has ordered the NCA and the state governments to respond till January 13, 1994. According to reliable sources, the Gujarat government and the bureaucrats at the centre have been stalling the process of deliberations. Gujarat is trying to get political mileage out of this issue as the assembly elections are round the corner. All the illegalities are being justified and pushed ahead only for gaining electoral benefits. The Gujarat government is intimidating the central Congress leadership. It is learnt that the state chief minister, Chhabildas Mehta, has requested the prime minister to increase the height of the dam in an Congress working committee meeting. Gujarat has made a pact with Rajasthan in demanding an increase in the height up to 100 metres, despite the failure to comply to any norm or plan of resettlement or environmental management. The Gujarat leaders have declared that the Supreme Court order holds little relevance to them. It seems that as in Ayodhya controversy, the dam supporters are out to defy the law, the Constitution and the judiciary of this land. It is no wonder that the pro-dam slogan, 'baandh wahi banega' recalls the earlier slogan 'mandir wahi banega'.

During the days of indefinite fast by Medha Patkar and her colleagues demanding stoppage of the work on the SSP, the Madhya Pradesh assembly discussed the issue three times. Two times the assembly was adjourned for the day. The assembly decided to send an all-party MLAs' team to assess the status of rehabilitation of the Madhya Pradesh oustees in Gujarat. After its tour of 19 resettlement sites between December 5-12, the committee presented an interim report to the deputy chief minister. The Singhdeo Committee concluded that

Even though only 2 per cent of the 33,014 families of MP who will be affected by the SSP, will be settled in Gujarat, in this short time and small amount of work, the NWDI award has been violated in several ways. The problems...include people who have been displaced without cultivable land...been given unproductive land... forest produce and grazing lands are scarce, house plots have not been allotted on time, public amenities are scarce...So far 75 per cent of the agricultural land given to the displaced families is barren and fallow, covered with shrubs, disputed, fragmented and encumbered. The figure given by the Gujarat government about the number of rehabilitated persons is false. According to a preliminary estimate, there are more than 1,500 displaced persons who have been given disputed, barren land. Out of these 800 are on the verge of returning to Madhya Pradesh. More than 90 per cent of the residential sites are far away from the host villages and surrounded by anti-social elements...These rehabilitation sites get waterlogged...no appropriate educational facilities, no permanent arrangement for providing employment... 80 per cent of residential sites only have saline water to drink, which is not potable... Village community has not been resettled as a whole... [has] led to breakdown of the unified society... Looking at the condition of small percentage of tribal and non-tribal rehabilitated persons who have been displaced from MP so far, it is absolutely clear that neither Gujarat nor MP

has the necessary capability and readiness to undertake huge task of rehabilitating thousands of displaced families.

The committee concludes,

the ongoing work on SSP is inviting a serious crisis of human rights and... this crisis is unnecessary... without forgetting that the SSP is an inter-state project [and] that the final decision cannot be taken by MP alone, we again state that the initiative must be taken to stop the ongoing work on the dam.

On the basis of this report the Madhya Pradesh government has declared that it would seek for lowering the height of the wall below 436 feet, depending on the circumstances of rehabilitation, water availability, and other factors. The state government has also appointed a committee of MPs from Madhya Pradesh to review all aspects of the SSP. While Madhya Pradesh seems to be taking steps, emboldened by the Supreme Court directives and the review report, the Maharashtra government still toes the anti-tribal line in backing the Gujarat government for continuing construction of the dam. The ex-chief minister Sharad Pawar and his bureaucrats have been brutal in their decisions, be it a matter of Gowari killings in Nagpur or the Narmada tribals. A statewide protest of tribals against this anti-tribal policy is taking shape. Meanwhile, the struggle in the Narmada Valley surges towards its goal with renewed vigour.

Politics of Communalism in Kerala

John Oommen

Apart from unique social structure and the geographic composition, opportunism of major political parties has intensified communalism in Kerala.

KERALA has always been affected by political instability right from its formation in 1956. It has seen no less than 10 elections and 15 ministries between 1956 and 1994. Except twice, no ministry could complete its normal tenure of five years in power. One of the reasons that contributed to political instability was communalism. This paper examines the growth of communalism and how it was used by the major political parties for furthering their own interests.

Defining communalism is a difficult task because it expresses itself in different forms and manifestations. But as George Mathew says, "Two subtle distinctions of communalism can be drawn up: (a) Communalism as a political doctrine; and (b) Communalism as a behaviour based on community sentiments" [Mathew 1989:11]. The first implies the tendency to use the religio-cultural differences to mobilise people for narrow political ends. Bipan Chandra defines "Communalism as the belief that because a

group of people follow a particular religion, they have as a result, common social, political and economic interests" [Chandra 1984:1]. To Rasheeduddin Khan, "Communalism is perversion of religion from a moral order to temporal arrangement of contemporary convenience, from a faith into a constituency, from a strategy of living into tactics of politics, from an end into a means" [Khan 1989:138]. Manu Bhaskar defines communalism as "Competitive group solidarities within the same political system based on ethnic, linguistic or religious identities" [Bhaskar 1987:245].

The second aspect of communalism entails a certain identity being transferred into a sense of community feeling. Here community means any group capable of developing a 'we' feeling, e.g. racial, caste, linguistic, religious, etc. As Louis Dumont puts it, "Communalism supposes the existence of a community, a group of adherents to the same religion, and it gets the edge of the meaning

through the parallelism with the other term: it is something like nationalism in which the nation, so to speak, is replaced by the community" [Dumont 1970:89].

Communalism as it operates in Kerala is very nearer to the second definition. Kerala is noted for its uniqueness in religious diversity and communal harmony as compared to other states. But with all these positive attributes, we find the electorate being swayed by communal feelings and identities. In a similar vein, the appointments to government posts are influenced by communal considerations. Moreover, there is the rising phenomenon of various communities launching their own political parties with a view to strike bargains during the elections and share the spoils of powers in event their alliance wins the elections. Communalism as prevalent in Kerala may be defined as a feeling of group solidarity among different communities and to assert its presence in the day-to-day functioning of society. Its style of operation is peaceful co-existence carried out through milder social processes [Thomas 1985:15]. The number of political parties that one finds in Kerala are nothing but a conglomeration of pressure groups and are meant to promote the interests of the communities. More employment, more business facilities, more forest land for cultivation, more schools, more seats in professional colleges, more berths in the ministry, are some of the issues around which communal parties and groups revolve. The communal interest groups bring with them the whole weight of the communities and are, therefore, powerful enough to dictate terms to the government. Before going into the dynamics of communalism, it is imperative to trace the growth of communalism in the state. [Vergese 1987:20].

HISTORY OF COMMUNALISM IN MALABAR

The origin and growth of communalism can be traced to the 16th century when the Portuguese made their appearance on the west coast of Malabar. With the advent of the Portuguese, who replaced the Arab traders, a certain amount of social tension arising out of their political and religious postures was incorporated into the Kerala society [Tharakan 1987; Dale 1975]. These tensions escalated into full-scale religious conflict during the 18th and 19th centuries. But many of the religious conflicts had a tinge of economic reasoning behind it.

The Muslims who constitute a majority in this region were mostly involved in agricultural occupations. Their conditions of life worsened after Malabar was ceded into the Madras presidency. As part of this presidency, the history of Malabar differed from that of the princely states of Travancore and Cochin. In the first place, its development was conditioned by its position as an extension of a largely Tamil province. Secondly, its people were involved in a

direct relationship with the British and their political institutions like the district collectors and sub-collectors.

The agrarian structure prevalent in the Malabar region was in favour of the Jenmis who owned more than half of the cultivated area. The Jenmis were the earlier Rajas, Namboodiris, important Nayar and Nambiar families and in some places the Moplahs, though the proportion was comparatively smaller [Miller 1970:18]. These Jenmis never cultivated land on their own but leased them to tenant farmers. As Manu Bhaskar pithily puts, "The Jenmis were the parasitic rent-receiving landlords under whom there were three or four intermediaries between them and the actual tiller of the soil, all having different interests" [Bhaskar 1989:78]. The peasants and agricultural labourers, mostly Muslims, who suffered under the exploitative system, began to revolt against the system. The peasant uprising, popularly known as the 'Moplah outbreaks', occurred in 1836. The most serious of this outbreak happened in 1921 which continued for six months and covered several villages. Though the immediate provocation for the violence was the frequent eviction, there were quite communal overtures to the movement which was essentially conceived of within the framework of Islamic religious traditions and legacy of struggles by the Moplah peasants of Malabar. The Moplah uprising changed the political complexion of the region. The Indian National Congress which had a presence in the area till then withdrew due to the increasing militancy of the Muslims, and thus, leaving the field open to

the Muslim League to take over. The alienation of the Muslims from the Britishers as well as the Hindus, helped the Muslim League to make inroads into the Muslim community.

The formation of the state of Kerala in 1956 gave a boost to the Muslim League in terms of its support base. Unlike in the Madras presidency, the Muslims became one of the four powerful communal groups in Kerala. Moreover, they were more cohesive than the other groups. Thus, the Muslim League used the solid block of Muslim votes as a lever to its advantage. The adage that politics is the art of the possible found an eloquent expression in the events of Kerala. In other words, the so-called secular parties see in the Muslim League a powerful ally inevitable for electoral victory, which is why the League, despite being a communal party, continues to play a decisive role in the politics of the state.

COMMUNAL POLARISATION IN TRAVANCORE-COCHIN

Travancore and Cochin, unlike Malabar, were retained as princely states under the British paramountcy. Here the origins of communalism can be traced to the awakening of nationalism among the people. As J N Gladstone opines, 'The growth of nationalism furthered the sense of freedom which had been stimulating various communities for several decades. On the one hand, people belonging to different communities shared the national feeling though their political aims were different from those of the people of British India:

on the other hand, in Kerala there was an attempt by almost every community to strengthen and improve its own members resulting in the growth of communalism" [Gladstone 1985:27]. This growth of nationalism was not channelised by the political parties since they failed to strike deep roots till around 1940s. Their role was taken over by leaders of various communities who submitted petitions and memorials to the government for redressal of grievances of their respective communities.

Till the beginning of the 20th century, the top positions in the government were always manned by outsiders, more particularly, the Tamil brahmins. As a protest against this domination by outsiders, various communities within the state joined together and submitted a petition called the 'Malayali Memorial' to the Maharaja in 1831. Their plea was that the Malayalis who had proven academic and other qualifications be preferred in recruitment to all levels of civil service [Tharakan 1988].

The opening up of the administration created resentment among various communities. The Nairs could take advantage as they alone had the necessary educational qualifications coupled with the required ritual for purity in a polity which was still governed by such traditional norms. T C Varghese says that the Malayali Memorial and the subsequent problems arising from it was a significant development in the growth of communal consciousness among various communities. He observes, "The exclusion of three major communities from government patronage was unfair, unwise and unfortunate. It not only sowed the seeds of discontent among them but also induced them to organise themselves on communal lines and fight jointly against the domination of those communities seeking royal patronage. The whole atmosphere was surcharged with communal hatred which set into motion the communalisation of politics" [Varghese 1970:26].

One of the manifestations of rising communalism was the formation of communal organisations like the Sree Narayana Dharma Paripalana Yogam (SNDP) and the Nair Service Society (NSS). The rising community consciousness kindled hopes and aspirations among the communities and they began to put forth economic and political demands like reservations in recruitment. In 1932-33, a number of communal organisations joined together under the banner of the Joint Political Congress. In January 1933, the Congress initiated a 'Absentation Movement' deciding to abstain from taking part either in voting or in accepting nomination to the legislative bodies so long as the government did not make provision for the election to the legislature of representatives of all communities in proportion to their strength of the population [Gladstone 1985:30].

The rising communalism among the various communities had a significant impact

on the politics of the state. This was because it was difficult to draw a line between the leadership of political parties and the communal organisations as the same leaders manned both these bodies. As TC Varghese observes, "The first generation of political leaders were none other than the leaders of their respective communities. They began their public life with the backing of their communities and services within the community was often a passport which enabled them to plunge into politics. Their first loyalty was always to their communities and commitment to the ideology of the party was of secondary importance. So the party had to lean heavily upon the heads of various religious and communal organisations to continue in office... The continued sway that the communal parties had over major parties was the reason why ideology-oriented politics did not get a foothold in Kerala politics" [Varghese 1970:25].

COMMUNAL POLITICS AFTER INDEPENDENCE

The merger of different units in 1956 to form Kerala in no way lessened the intensity of communalism that prevailed in different areas. On the contrary, communalism got intensified and the different communities began to assert themselves with redoubled vigour in the politics of the state. For the Muslims, the merger helped them to become one of the important minority groups in the state. The other communities also used their vote banks to wrest as many concessions as possible from the government.

The major communities in Kerala are the Ezhavas, the Nairs, the Muslims and the Christians. These four communities comprise roughly 80 per cent of the state's population

and various governments have survived or fallen due to the shifting alliances of these communities. The demographic composition is such that each community is in a position to dictate terms to the political parties. One significant factor about these communities is their geographical concentration. Although they are scattered throughout the state, they have certain areas of concentration or what may be called 'pocket boroughs' [Chander 1986:19]. Out of the total of 14 districts in the state, the Christians and the Muslims constitute a significant number in six districts. In one district, Malappuram, the Muslims constitute more than 60 per cent of the population (see Table). This geographical concentration helps the communal parties like the Kerala Congress and the Muslim League to win more seats from the Christians and the Muslim dominated areas respectively.

Each of these communities has organisations running schools, colleges, hospitals, etc. and some of them publish their own newspapers. An interesting feature is that almost all the existing private colleges in the state can be associated with one or another of these communities. This is probably one of the reasons why the education portfolio is almost always in the hands of a pro-Muslim League fellow as it is now, or a pro-Christian Kerala Congress fellow or with parties such as SRP and the Janata Dal, which have more clout within the coalition governments than enjoy public support in the state.

Over the years, the communal groups have created for themselves an important role in the coalition politics of the state due to their ability to become instruments for expressing political preferences and mobilising political

ARECANUT PRODUCTION AND MARKETING IN INDIA

By
S Giriappa

The book highlights the commercial crop of great significance the 'Areca nut' which is gaining industrial status in Indian economy. It attempts to study the cultivation and marketing of areca nut in the producing and consuming centres. While Karnataka and Kerala regions have been studied for production and primary marketing, different consuming centres throughout the country have been studied in respect of secondary and tertiary marketing.

resources and support. In the realm of politics, they act as pressure groups and guard the interests of their respective communities. The sharp division of the society coupled with the mosaic nature of politics makes the various community interest groups far more important. They play a crucial role in the making and unmaking of governments. Sometimes, the 'social arms' get converted into 'political arms' so as to project the community interests more forcefully. Accordingly, the Muslims have the Indian Union Muslim League (IUM), the Nairs, the National Democratic Party (NDP), the Christians, mainly, the Kerala Congress (Mani) and the Kerala Congress (Joseph), and the Ezhavas have the Socialist Republican Party (SRP). Given the individualistic nature of the Malayalis, the parties underwent fissions resulting in spawning of new parties. This resulted in a situation wherein Kerala began to be ruled by coalition governments as no single party could win majority of seats on its own. As the coalition government consisted of disparate communal interest groups, interest aggregation became a difficult proposition.

The high level of caste consciousness is also one of the contributing factors in the shaping of political behaviour. The Hindus are divided on caste basis and hence cannot take a united stand in the electoral game. This is in contrast to the Muslims and the Christians who are more organised and show more solidarity in the electoral exercises. This solidarity certainly helps them in greater bargaining capacity in securing concessions from the government. It is the claims and counter-claims regarding the bargaining capacity that reinforces the communal polarisation of the communities giving rise to instability of the political system. Apart from these specific social conditions, communalism gets intensified in Kerala due to the absence of ideology among political parties and dominance of opportunistic politics. Alliances are formed not on the

basis of ideology but on the basis of getting maximum seats at the time of elections. The small communal parties see the advantages of retaining their identity for bargaining with the major parties. The major parties for narrow electoral considerations show no qualms in entering into seat adjustments with communal parties. The result of this opportunism displayed by major political parties is that these small parties begin to call the shots in politics. Any reluctance on the part of the government to accede to their demands results in shifting of their loyalty to the opposite front. The net result was political instability at the macro level. For instance, the Kerala Congress (Mani) quit the LDF under the pretext of law and order problem in 1982. The Kerala Congress (Joseph) threatened to quit the front when the government refused to give title deeds to those who had encroached on the government land. The UDF government had to give in to this demand so as to continue in the office.

Both the Communist and the Congress parties have played a role in the growth of communal politics in Kerala. The Communist party could attain power in 1957 only because of the co-operation and support extended to it by some communal powers and the tactics of identifying their candidates according to the communal ratio [Varghese 1970]. The Liberation Movement of 1959 against the Communist government strengthened communal pressure groups and the fall of the ministry can be attributed to the agitation led by these groups. The Communist party's alliance with the Muslim League in 1967 and the formation of Malappuram district is another instance of a party succumbing to pressure politics. During the 1987 elections, the CPI(M) severed its ties with the All India Muslim League (AIML) against the background of the Shah Bano case. But lately FMS Nambodiripad who had advocated a strong stand against the AIML then, is talking of forging alliance with the Indian National League led by Ibrahim Sulaiman Sait. The compelling factor behind this change of policy is the forthcoming election in the state. The CPI(M) knows that it is difficult for the Left Democratic Front to come to power on its own. The support of splinter parties is crucial considering the wafer-thin majority that separates the victor from the loser in Kerala.

The Congress with all its secular credentials in not aligning with communal parties finally tied up with the Muslim League and the Kerala Congress to fight the Communists. The opportunity it got to rule the state was more powerful than the ideology it professed. At one time, almost all communal parties were part of its front. Sanctioning pensions to the Ulemmas, declaring Friday as holiday for schools with a majority of Muslim students and granting title deeds to those encroaching on government land are

instances of appeasement of the communal parties by the Congress. Another instance is the Congress(I) vacating its Rajya Sabha seat to the IUM in order to placate the latter which suffered a drubbing during the Guruvayoor assembly election.

Thus, communalism constitutes almost an essence of politics of Kerala. Apart from the unique social structure and the demographic composition, communalism got intensified due to the opportunism displayed by the major parties. By aligning with small splinter communal parties, the major political parties which could have played an important role in secularising the political process became a participant to the communal processes. Consequently, the communal divide in the society gets reinforced and the possibilities of a consolidated secular base for the political systems get narrowed.

India on the Eve of Copenhagen Summit

Issues in Social Development

Rajiv Balakrishnan

In its 50th anniversary year, the UN is hosting an international summit on social development with three core themes of alleviation and reduction of poverty, generation of productive employment and enhancement of social integration. An Indian perspective on these facets of social development, reviewing the contributions to a recently published volume.

ITS traditional role of preserving world peace and mediating conflicts between nations muted with the demise of the cold war, the United Nations prepares to take on a new identity in the closing years of the 20th century. Security from territorial aggression, the UN's *raison d'être* of the past, now yields to a 'new concept' of human security, or security from threats to human welfare. From the inception of the United Nations, the two components of security – freedom from fear and freedom from want – have been recognised. In the past, it is the first aspect that has been emphasised. Now, a shift from a preoccupation with national security to a growing concern with human security is on the world's agenda.

Human security comes to occupy centre stage in the UN and in the international arena at a time when human security problems within nations are widely perceived to have international consequences. This is an inevitable adjunct to that overarching phenomenon of our times – globalisation. Markets across the world have become extensively integrated, so that if economic activity in any part of the globe is undermined as a consequence of underdevelopment and its attendant 'human security' problems such as poverty and low productivity employment, this becomes a matter of international concern. Other examples of global dimensions to 'threats to human security' include, as the UNDP's Human Development Report (1994) points out, anomy in the advanced societies of the west and its fostering of the widespread use of narcotics, which in turn sustains dictatorial regimes sponsored by drug cartels and drug barons in the less developed world; and refugee migrations, fuelled by problems of underdevelopment. Likewise, when economic output suffers as a consequence of, for instance, the popular unrest or ethnic strife that accompany unemployment and poverty, the repercussions, felt beyond national frontiers, fuel international concern with issues of 'human security'. Threats to human security that are of worldwide concern include population growth as an

inhibitor of development and environmental degradation.

Along with the growing worldwide concern with 'human security' is the realisation that contrary to conventional wisdom, human security does not necessarily follow from economic growth. (This is strikingly demonstrated by the UNDP's ranking of nations by GNP per capita and separately by the Human Development Index.) The international preoccupation with issues of 'human security' is consequently complemented by the recognition of the need for deliberate efforts to promote it via social, rather than purely economic, development.

It is against this backdrop that the UN, in its 50th anniversary year, is hosting an international summit on social development. In Copenhagen, the venue of the summit, representatives of nations gather this month to discuss the state of the world. Their deliberations coalesced around three major dimensions of human security – the summit's three 'core themes' of the alleviation and reduction of poverty, the generation of productive employment, and the enhancement of social integration. This paper presents an Indian perspective on these facets of social development, reviewing the contributions of scholars whose writings featured in a recent volume [Muchkund Dubey (ed), *Indian Society Today: Challenges of Equality, Integration and Empowerment*; Har Anand Publishers, New Delhi, 1995; sponsored by the Council for Social Development, New Delhi].

The first paper is by Rajni Kothari, who speaks of the need for a 'trickle up' developmental model; for an 'alternative path to development' geared towards distributive justice, wherein the emphasis is on employment generation rather than growth *per se*, on raising purchasing power in the internal market rather than seeking succour from the external one, on rural development, and on 'the small and tiny sectors', focusing on the creative capacities and traditional skills of artisan communities. Such a paradigm of development would draw in migrants from rural areas, women,

and workers in the unorganised sector. Kothari points out that it is now recognised that development is far more than merely a matter of economic and technological striving. These will reduce poverty and disparity and promote social justice only if the people, particularly the poor and the discriminated against, are empowered, by being equipped socially, via education, health and housing and control over natural resources.

In their contributions, K C Alexander and V S Vyas provide evidence of government policy in India having been informed by the 'new wisdom. Alexander depicts official policy since the 1960s, when it became widely felt that the theoretical 'trickle down' effects of growth did not significantly translate into improvements in the living conditions of the poor. The thrust of the government's perspective, he points out, has been to fight poverty through the provision of productive assets, with an emphasis on helping the poor improve their productive capacity; and via the provision of employment to those who cannot effectively manage assets. Apart from the ethical desirability of this approach, it was felt that the potential for economic growth could not be fully realised unless the productive energies of the poor were harnessed. This, Alexander argues, is the context of the country's poverty alleviation programmes.

Pointing to the limitations of these programmes, Alexander identifies 'stumbling blocks' – among them, values inimical to development, such as a lack of motivation, and population growth. He emphasises the importance of education and knowledge, which lead to higher productivity, and which have been poorly integrated into the country's programmes for poverty alleviation.

In a similar vein, Vyas points out that the concern with 'high quality growth', or 'growth with justice', has been fostered by the recognition that economic growth is by itself no guarantee of improvements in the well-being of all sections of a country's people. While this awareness has guided government policy in India in the past, we are now revisiting that concern in the context of the global climate of liberalisation. A dominant theme in the current discourse, Vyas indicates, is the view that an acceleration of the pace of growth would translate into a 'spread-over effect', felt by the various sections of society. That perception notwithstanding, there is a worldwide commitment to not just growth, but multi-dimensional development, a commitment that is reflected in the three core themes of the Copenhagen summit. 'Social integration', or the integration of the marginalised poor into the socio-economic mainstream, is a key element in the picture, Vyas argues; and for the enhancement of the participation of marginalised groups in the growth process,

three areas of concern are vital – access to adequate food, education, and health. India has had a tradition of public intervention in all three areas. In the vital sphere of 'food security', he says, improvements owe much to interventions in the public sphere. Agricultural price policy, geared to ensuring that productivity gains in the foodgrains sector were fairly divided between producers and consumers, contributed to containing increases in the real prices of foodgrain. Considering that the poor spend three-fourths of their incomes on food, this was significant in ensuring 'food security'. The public distribution system, put in place before independence and designed to distribute foodgrains at controlled prices, has been a significant factor as well. Employment and other poverty alleviation programmes, including famine relief measures, despite all their shortcomings, have played an important role in promoting 'food security'.

The success of economic reform in India, Vyas says, is a function of, among other things, human resource development and infrastructure, areas in which "... a more active role for the state is clearly called for". There is all the more need for this in a country like India where a high rate of growth can occur, at least in the medium term, even if only households in the medium and high income groups participate in the growth process and benefit from it. That pattern of growth, non-sustainable for long in a democratic setup, calls for remedial state action. A constant refrain of the New Economic Policy – curtailment of government expenditure in the social sector – would thus have adverse consequences for the poor, more so in the light of the elitist bias in existing expenditure allocations, manifested, for instance, in outlays for higher education at the cost of primary education; and in an emphasis on the curative health services in urban areas at the cost of expenditure on more widespread preventive services. While biases of this type are not necessarily integral to the New Economic Policy, "... these trends could get strengthened with the introduction of economic reforms if deliberate efforts are not made to ensure that the poor have access to adequate and nutritious food, elementary education, and basic health services". To ensure this, mere expenditure outlays are not adequate, as the bureaucratic machinery's ability to deliver the goods leaves a great deal to be desired. On the other hand, exclusive dependence on the market mechanism to facilitate access to essential facilities such as those pertaining to health and education, could be inequitable. There is however, a third force, that of people's initiatives. The scope for this, well-grounded in Indian traditions, has been enhanced with the recent invigoration of panchayati raj.

Kamala Prasad, in his paper, focuses on another potential harbinger of a more

equitable and socially just order, namely, land reform. Adopting a historical perspective, Prasad tells us that a new elite of middle caste agricultural entrepreneurs, emerging on the scene with the abolishment of zamindari (intermediary) rights in land, went on to profit from the green revolution and to transform their new-found socio-economic standing into political clout. This new class, seeking to maintain its hegemony, works to obstruct access to land for such groups as tenants, sharecroppers and landless labourers, as the ultra left movement in Bihar has decisively demonstrated. At the broader political level, centrist political parties, influenced by landed interests, are not truly committed to land reform measures. The bureaucracy too plays a retrogressive role; a compliant land reform administration, guided by the interests of a patronage – providing dominant landowning class, has obligingly obstructed the implementation of land reform measures. Land reform legislation as it impinges on tenancy and sharecropping is a tricky business, Prasad points out. Tenants are apprehensive of eviction and absentee landlords fearful of loss of ownership. To subvert tenancy legislation, concealed tenancy has prevailed on a massive scale. In such a situation, implementation is problematic, but West Bengal shows the way. Its Operation Barga, aimed at recording all tenancies and sharecropping arrangements and employing a strategy of local mobilisation backed by the authority of the government, has yielded rich dividends in terms of the realisation of the ideal of land to the tiller. Prasad argues that political commitment by itself is not enough; a tradition of grass roots activism is also necessary. Thus, while the success of land reform measures in West Bengal and Kerala can be attributed in part to political will, this by itself is inadequate. The role of grass roots traditions of mobilisation can be seen if one considers that in West Bengal, mobilisation for land reform enjoyed greater success in areas that had a historical tradition of peasant movements. Measures to ensure the viability of small holdings, a necessary supplement to the socially ameliorative aspect of land reform, include wage employment programmes to make marginal landholders more viable; programmes for irrigation development; consolidation of holdings with provision for improved infrastructure; and poverty alleviation programmes to ensure that beneficiaries of land reforms are viable. The emphasis should be on egalitarian land reforms geared to creating viable farms that can participate in market mechanisms and bring prosperity to the rural masses, along the lines of the experience of such countries as China, Japan and South Korea.

Sheila Bhalla's paper, 'Employment, Productivity and Workforce Development in India', studies aspects of the poverty and

employment situation in the country. Bhalla points out that it is low productivity employment rather than open unemployment which is the main employment problem in India. Low productivity employment, judged in terms of the proportion of households below the poverty line, plagues vast sections of the workforce. Bhalla argues also that in recent decades there has been a transfer of this human misery from rural to urban areas. She suggests that recent developments augur ill for the employment situation in the country. She presents data to show that employment elasticities have declined since the early 1970s, so that "... the Indian economy has to grow much faster now to generate the same amount of fresh employment as it did in the 1970s". In many states, employment elasticities in agriculture have been negative. In the case of non-farm activities, employment elasticities have been much higher in the unorganised sector. In the urban organised sector employment elasticities have gone down as, fuelled by compulsions of international competition – cost reduction and improvement in the quality of products – this sector has become more capital-intensive. Unlike in the case of the urban organised sector, technological change cannot be blamed for low employment elasticities in agriculture. In the agricultural sector, new technology was "... almost as often labour using as labour saving". Here, low unemployment elasticities have their sources in the mechanisation of agriculture as a strategy of reducing wage bills in the face of wage increases resulting from the siphoning of surplus labour into the non-farm rural and urban sectors. Given that the employment potential of the rural non-farm sector holds the greatest promise, rural diversification programmes would be in consonance with trends already established, Bhalla argues. However, while an "agriculture-led workforce diversification process seems to have taken place in the period preceding 1961", subsequently, rural workforce diversification has been induced mostly by "forces originating outside the agricultural sector". Yet, agriculture "remains one of the keys to sustained overall industrial growth in India". In the agricultural sector, Bhalla indicates, employment depends critically on the expansion of gross cropped area; this calls for a strategy of investment in rural infrastructure, particularly irrigation.

Vandana Shiva, using an ecological framework, provides yet another perspective on the country's poverty. Shiva argues that the dominant paradigm of market-based development has grievous consequences for the marginalised poor. In making her case, she identifies three types of intermeshing economic systems. These include, apart from the 'market economy', the 'economy of natural ecological processes' (or 'nature's economy') and the 'sustenance economy'.

In a lucid exposition, Shiva discusses the guiding principles of each and spells out the implications of their intermeshing. The most fundamental of the three is 'nature's economy', in which regenerative ecological processes 'produce' a range of natural resources such as humus from forests, water, etc. 'Nature's economy' fosters the 'survival economy', in which large numbers of poor in the third world derive livelihoods directly from fodder, fuel, and other products of nature's bounty. The market-based development paradigm, with its emphasis on commodity production and capital accumulation, Shiva argues, has encroached upon the preserves of 'nature's economy' and the 'sustenance economy', resulting in a diversion of life-sustaining resources to cash crop and commodity production. Historically, this has taken the form of capitalist appropriation, or privatisation, of the 'commons', or the communally-held resources of the 'sustenance economy', with the attendant dispossession of those for whom the commons is a source of basic needs fulfilment. In more recent times, the 'privatisation' of the commons has given way to a more insidious form of capitalist appropriation via the privileged use of technology. Examples include cases of traditional fishermen dispossessed of their rights in the commons of the sea or river by the technology of mechanised fishing. In this scenario, the use of technology and financial investments by the privileged few are the major agents of a "tacit and hidden dispossession", with international aid and technology transfer the major culprits abetting the transfer of resources from nature's economy and the sustenance economy to the market economy. The process is one in which local resources come to be increasingly controlled by international agencies like the World Bank, with appalling consequences. On the one hand, there is an "anarchy of resource use" in which affluent enclaves thrive even as the resource base of the poor shrinks. On the other hand, nature's law of returns is eclipsed by the imperatives of financial returns to investment, so that 'nature's economy', overexploited, suffers ecological damage. Having depicted the dismal consequences of the market-oriented development paradigm, Shiva builds up a case for a way out. A more rational and equitable strategy of resource use is called for, she argues. The key, she suggests, "...seems to lie in giving local communities control over local resources so that they have the right and responsibility to rebuild nature's economy, and through it, their own sustenance".

Viewing the market development paradigm's adverse consequences through the lenses of an institution that is crucial for human welfare – the family – Murli Desai points out that in the agricultural sector, the

NEP has meant an undermining of subsistence in favour of cash crops. More generally, the NEP has aggravated the marginalisation of families that lack access to, and control over, resources, such as the families of landless and marginal farmers, pavement and slum dwellers, and unorganised labour. In the formal sector, reductions in the workforce have meant that "women are the first to go as they are largely in the aided social sectors of health and education". "As large numbers of men lose employment, the load on women to earn through the informal sector increases." More generally, Desai's paper deals with various facets of the family, including the relationship between the family and the state. Focusing specifically on patriarchy as it imbues state policy, Desai decries the encroachment of patriarchal ideology into the public sphere. The phenomenon can be seen, for instance, in the realm of family law. Thus, in India, matters pertaining to marriage, divorce, adoption, maintenance, etc. are not subject to a uniform civil code but instead depend on religious norms which "...often perpetuate patriarchy in the family, violating the principle of equality and justice". In the case of laws that are covered by a uniform civil code, such as the Child Marriage Restraint Act, the Medical Termination of Pregnancy Act, Special Marriage Act, Dowry Prohibition Act, and provisions in the Criminal Procedure Code and the Indian Penal Code, "...interpretation and implementation ... leave much to be desired".

Shiva Kumar's paper focuses on a particularly vulnerable category of the family's constituents – children. India's standing with respect to her professed goals of providing for the protection and development of the country's children, Kumar points out, is abysmal by international standards. Thus, that measure of child welfare, the under-five mortality rate, 124 per thousand live births in India in 1992, indicates that the country stood well above the world average of 97, and was far removed from Japan's accomplishment of 5 per thousand. Data show also that the deprivation of girls, as reflected in child survival, is far greater than that of boys. In 1981, in 224 out of 402 districts, child mortality was higher for females. This dismal child welfare scenario has a bright side, however; if one looks at the child survival scenario over time, statistics show a reduction of the under-five mortality rate (U5MR) from 236 per 1,000 in 1960 to 177 in 1980 and 124 in 1992. The accelerated decline between 1980 and 1992 is particularly impressive as lower rates of decline in this period were reported by only 45 out of 145 countries.

Profiling deprivation in the vital educational sphere, Kumar indicates that in 1991, some 19 to 24 million children aged 6-14 years, over 60 per cent female, were

illiterate. Data from several parts of the country show also that primary school enrolments are better among boys, and drop-out rates higher for girls. As for children not in school, they invariably work. Kumar states, "either at home or outside". According to the census, there were 13.17 million workers below the age of 14 in the country in 1981, most of them engaged in agriculture. NSS data for 1983 indicate 17.36 million child workers aged 5 to 15, and the Operations Research Group places the figure at 44 million in the same year. Many of these child workers are paid exploitative salaries. Others, for instance girl children employed in domestic activity, are not paid at all. Problems of destitute and street children cry out for attention as well, Kumar adds.

Arguing that the income level is not an acceptable predictor of child welfare, Kumar points out that while Punjab's per capita income is twice Kerala's and Manipur's, its IMR is two to three times higher. Growing incomes, to translate into child welfare, must therefore be appropriately channelled. The country's experience suggests significant disparities in this respect, as indicated by the fact that despite a higher per capita income, Haryana's health expenditure is less than that of Himachal Pradesh. Kumar argues further that physical provisioning is important but not adequate. He points out that the country's impressive gains in terms of per capita food production, public distribution and Integrated Child Development Services (ICDS) notwithstanding, malnourishment afflicts an estimated 63 per cent of the population under five, a figure considerably higher than the developing country average of 36 per cent, and surpassed only by Bangladesh's figure of 66. According to Kumar, what is called for in this context is an 'integrated approach' encompassing support for the livelihood strategies of the poor, child care, and provision of adequate access to health facilities.

Kumar argues that "...there is more to basic education than construction of school buildings and recruitment of teachers", that there is instead a need to better understand "retention, attendance, the quality of education, and the teaching and learning environment". Government intervention does play a crucial role; the state's role in the virtual elimination of famine is well known. India's government-sponsored immunisation, total literacy, teacher empowerment and education improvement programmes are other cases in point. But child welfare also depends critically on the level of social development. Thus, in the health sphere, women's involvement in the workforce, female autonomy, political awareness and political participation are crucial explanators of child health. On the basis of a doctoral study undertaken by him, Kumar argues that these factors underscore

the phenomenal success stories of infant mortality reduction in Kerala and Manipur. His prescriptions include: an active role for government in "ensuring socially desirable levels of provisioning and resource allocations"; the need to generate more credible and useful data; the strengthening of legislative safeguards for children; the promotion of greater local community involvement in planning, implementing and monitoring programmes for children, along with concerted action by government and non-governmental bodies; a non-adversarial partnership between government and NGOs; and the necessity to go beyond increased budgetary allocations for children to a concern with cost effectiveness, access and quality of services.

Contributors to the book emphasise the need for inputs in critical social sectors, without which economic growth by itself will not translate into social development. The papers deal separately with the crucial 'social sectors' of health, education, and housing. N H Antia, analysing the health situation in India, argues that in addition to the paucity of funds, a consideration which imposes a great burden on the public health system, there is an absence of political will to equitably share available resources. The elite-dominated political system promotes private sector monopoly not only of health manpower and finance but even of the resources of the public sector itself. Thus, of the 13,000 doctors trained annually by the public sector, three-fourths serve in the private sector. Other factors identified as salient on the health front in India include: reductions in budgetary allocations for health including water and sanitation, as concomitants of structural adjustment; the inability of the bureaucratic machinery to effectively deal with water and sanitation in rural areas, and the consequent incidence of water-borne disease and the "...spectre of massive resurgence of disease and death as a result of malnutrition ... in an economy where the strong dictate to the weak... where almost half of the population lives below the poverty line ... and where the last two deciles have only a tenuous hold over life..."

Antia cites the cost-effective aspects of western medicine as they operate to control communicable disease, and points out that with the primitive levels of this technology, three great killers – malaria, smallpox and cholera – were brought to book in the first two decades after independence. He adds that "...in the next two decades despite a vast increase in medical manpower, infrastructure and the availability of far more effective technologies, there has been a resurgence of malaria and cholera as well as of diseases like tuberculosis, gastroenteritis, pneumonia, measles, filaria and kala-azar for which far better knowledge of the disease process and technology for their prevention, treatment

and control are now available". Why did this happen? Having raised the question and whetted the reader's appetite, Antia should have given us some indication of where the answers lie. That notwithstanding, he has touched upon an issue that must surely feature as a salient one among students of medical sociology.

Antia's prescriptions include investments in literacy, particularly female literacy, a policy thrust that could be expected to result in "...better utilisation of available nutrition, improvement in sanitation with decrease in water-borne disease, and better demand for and utilisation of health services". He speaks of the need for political will that is committed to the needs of the majority "rather than the exotic demands of the few", and refers to success stories from India, among them, cost-effective NGO health projects based on the comprehensive decentralised health care model recommended by the Bhoré Committee. Antia calls for a greater role for panchayati raj bodies in mobilising community participation, and pleads for a system accountable to the people in place of the existing bureaucratic, target-oriented one.

In his paper on education and social development, S C Nuna points out that education has a critical role to play in development, for instance, by contributing to improvements in productivity and the utilisation of employment opportunities. It is also a significant determinant of the quality of life, as evidenced by the role of female literacy in improving health and nutritional levels and containing infant mortality. This broad context, Nuna points out, forms a backdrop to the National Policy on Education, which envisages the growth of education as part of an integrated policy package for the removal of social, economic, regional and gender disparities. The challenges that lie ahead, according to Nuna, include the universalisation of primary education and the vocationalisation of secondary education, removal of regional, gender and social disparities, strengthening of links between education and the labour market, and transforming the system from one that is teacher-oriented and geared to the assimilation of 'received truth' to one that emphasises the creativity of the learner.

Amitabh Kundu and Archana Ghosh, writing on the shelter problem in India, indicate that in recent years the government's approach to the housing shortage has been characterised by an emphasis on effective demand to the detriment of the affordability criterion, with the new approach reflected in the National Housing Policy. Discussed in various fora in the late 80's and adopted by parliament in 1992, the NHP suggests that public housing agencies be made more cost-effective and undertake more commercially viable projects. The criterion of commercial viability, however, seems likely to further

inhibit the flow of institutional finance into unremunerative housing projects for the poor. Kundu and Ghosh argue that given the low recovery rate for loans given for housing projects in the 'economically weaker sections' and 'low income group' categories, public housing agencies (PHAs) have been reluctant to seek funds from the major agency refinancing these, the Housing and Urban Development Corporation (HUDCO), which earmarks 10 per cent of its funds for remunerative projects but requires that 55 per cent of its remaining disbursements be allocated for EWS and LIG schemes. Given the difficulty of disbursing its quotas of EWS and LIG funds to PHAs, HUDCO finds itself hard put to enforce its conditionality that disbursements under the EWS and LIG schemes go to recipients whose incomes fall below the prescribed level. These schemes would at any rate be beyond the financial reach of the bottom 40 per cent among urban households ranked by income level, a circumstance that promotes a 'filtering up process' whereby better off households avail of EWS and LIG funding. Further, problems of cost recovery being what they are, HUDCO has over the years permitted public housing agencies to shift from a hire-purchase approach, wherein cost recovery is spread out over several years, to the self-financing system, which requires that beneficiaries pay the full cost at the time of purchase. As a consequence, housing has gone even more beyond the reach of the urban poor.

On the theme of 'social integration', or the 'integration' of marginalised groups into the 'mainstream' of Indian society, the book has contributions by Asghar Ali Engineer and Yogendra Singh. Engineer focuses on the obstacles, essentially political, to the 'integration' of a religious minority, the Muslims. Yogendra Singh's paper focuses on the 'integration' of three broad categories of marginalised groups – the scheduled castes, the scheduled tribes and the backward classes. Both Singh and Engineer present the issue of the integration of marginalised groups in historical perspective.

Colonialism, Singh argues, gave rise to a 'two pronged' movement in India. Among the traditional upper caste elite, it engendered nationalistic sentiments coupled with the need for basic social, cultural and economic reform of society, of which they were a dominant and privileged constituent. Among the most exploited groups such as the dalits, tribals and peasants, colonialism "exemplified exploitation" and stimulated protest movements. Both trends were anti-British, but there was a tension between the two; while the nationalist movement's integrative pulls aimed at incorporating the marginalised groups of Hindu society into a reformed Hindu nationalism, this was resisted by pressures for cultural and social autonomy. The tendency towards autonomy,

Singh points out, was forcefully articulated by Jyotiba Phule, the 19th century radical who envisaged a front of dalits and 'backward castes', united in opposition to the exploitativeness of both the brahminical order and the colonial state. At a later phase, Ambedkar too envisaged the unity of the 'non-brahmins' in a struggle against the traditional caste-brahminical order. But Ambedkar also espoused a historically new perspective in which caste and religion were rejected as principles of integration in favour of the universal and humanistic values of the Constitution of India, to which he made a leading contribution. The Constitution did acknowledge caste by singling out the SCs, STs and OBCs for protective discrimination, but only as a time-bound policy.

In assessing the effectiveness of the constitutional paradigm of integration, Singh argues that while on educational and cultural fronts the marginalised groups have made considerable progress, they have lagged behind in the economic and social spheres. For instance, gains on the literacy and employment front among the SCs notwithstanding, as many as 72 per cent are marginal farmers and another 12 per cent landless labourers. Further, in 1982-83, as many as two-fifths of the SC population in urban areas and half the population in rural areas were estimated to be below the poverty line. The OBCs, while historically aligned with the dalits in the fight against brahminism were socially and economically much better placed than the latter. Peasant castes with a strong agricultural tradition, many of them were substantial landholders. A large section continue to be impoverished and in need of protective discrimination, but a 'substantial minority' have amassed economic and political power. With their rise to political dominance and their growing social and economic status, the OBCs, far from being a marginalised group which has to be integrated into the centre of Indian society, "...constitute the new centre of Indian society in the making". As for the scheduled tribes, their marginalisation and deprivation have been extreme, Singh asserts. While pointing out that militant demands for political autonomy have characterised tribal struggles against exploitation, Singh strikes an optimistic note, placing his faith in the restoration of democratic rights and the processes of development that make for constructive links between the tribals and the wider society. Singh concludes by arguing that primordiality, which has formed the grounds for the mobilisation of the marginalised groups cannot provide a stable basis for their integration into Indian society. While traditional caste society and the jajmani system it encapsulated formed a basis of integration in the past, it was a system in which inequalities were legitimised; now, the old order has been replaced by the republic

and the nation as alternative principles of integration into "a plural societal framework". Singh argues that it is "association of interest groups" and not caste that is the new paradigm of societal integration.

Singh's paper is followed by Engineer's analysis of the factors which jinx the 'social integration' of the country's Muslim community. The thrust of Engineer's paper is that tensions between the country's Hindus and Muslims have fed into and been exacerbated by the political process. He reiterates this view as he traces political developments in the country over the decades. Citing Indira Gandhi's rise to power on the socialist, secular, pro-weaker sections/minorities stand, Engineer maintains that political opposition took the form of propaganda which was aimed at inciting communal tensions. The intention, Engineer argues, was to erode that key element in Gandhi's electoral success — her platform of secularism. During the early 70s, the picture changed as, following the Bangladesh liberation war, Gandhi's popularity was at its peak and her political position unassailable. Simultaneously, there was a drop in the communal temperature and a respite from communal rioting. Subsequently, during the emergency, Gandhi and her son Sanjay

antagonised Muslim sentiment with the government's coercive family planning drive by its forcible demolition of Muslim homes near Turkman Gate, an episode which involved police firing and deaths of children crushed under bulldozers used in the operation. With the press muzzled, the Turkman Gate episode assumed exaggerated proportions through the spread of rumours, causing widespread disenchantment. Eventually, when elections were held in 1977, the Muslims for the first time after independence voted for a non-Congress party. Though the Muslims subsequently voted for her in 1980 in the absence of a viable alternative, Gandhi realised she could no longer command the Muslim vote as massively as she did before. Consequently, she began to cast her political net wider, seeking to compensate Muslim support with middle caste Hindu votes. In the process, she began to pedal soft communalism. Spurred by the political challenge of Gandhi's soft communalism and RSS support for it, the BJP, a party committed to 'secularism and Gandhian socialism' began to take a hard communal line. These political developments overlapped with a softening of Gandhi's stand against the RSS. Until 1979, she had stridently blamed the RSS for inciting

OUTSTANDING BOOKS

TRENDS IN AGRICULTURAL INSECT PEST MANAGEMENT

Editors : G. S. Dhaliwal & Ramesh Arora

Presents a systematic account of various tactics used for management of major insect-pests of principal agricultural crops of India.

communal rioting. Afterwards, she stopped doing so.

Engineer goes on in this vein, using an essentially ballot box paradigm to analyse the events surrounding such developments as the Meenakshipuram conversions, the Shah Banu case, and the Ram Janmabhoomi-Babri masjid conflict. These, he claims, revolved essentially around the politics of identity. Engineer sees this as integral to a theoretical framework wherein, with a deepening of the political process, political consciousness in a relatively backward developing country setting gets to be articulated in terms of the economic and political aspirations of ethnic communities, with deprived ethnic groups mobilising for redressal and entrenched groups seeking to preserve hegemony. In such a scenario, ethnicity becomes a factor in political equations.

At one point in his paper, Engineer fleshes out this paradigm with an illustration of the overlap between deprivation and ethnicity among the Muslims of India. He points out that following partition and the Pakistan-bound emigration of the propertied and the professional and educated Muslim middle classes of UP and Bihar, the poorer Muslims, who then constituted the bulk of the Muslim population of the region, found themselves bereft of the progressive role that the educated Muslim middle classes could have played. While Engineer presents us with an abbreviated tour of the recent political history of Indian communalism, he is silent about the circumstances under which the politics of identity yields to the politicisation of such vital issues as health, literacy and potable water in rural areas.

Vina Mazumdar's paper suggests that there is grounds for hope on this count and that this stems from the growing strength of the women's movement in India. Mazumdar argues that the institutionalised oppression and subjugation of Indian women via 'structures of patriarchy', operating through the family, community and the state, form the backdrop to a grass roots movement for women's emancipation in the country. While the nationalist movement, emphasising equality of all before the law, militated against the subjugation of women in the inherited social order, processes of political and economic transformation strengthened and reinforced structures of patriarchy and contributed to the economic marginalisation of women. Yet, despite all the factors working against it, the urge for women's emancipation would not be suppressed. This is a source of optimism, not only because it is a counter to the forces operating to perpetuate the oppression of women in society, but also because it augurs well for a broader tradition of popular participation. Mazumdar points out that "at various gatherings away from the controls exercised on them by the family, community and other collectives, women

demonstrate their urge and capacity to break free of all such boundaries... They do not seek to disown their obligations or attachment to the family, but crave for an additional, alternative or extended identity to articulate their anguish at the destruction of their natural and social environment, of the threatened future of their children and their own capacity to nurture them, and their determination to achieve solidarity in the common struggle for a better future for all."

Complementing Mazumdar's perspective, Dinesh Mohan's paper points to another front on which the scourge of communalism needs to be countered. In presenting the backdrop to his perspective on the communal menace, Mohan argues that in this age of instantaneous global audio-visual communication, accomplishments are judged on an international scale and the worth of nations assessed in terms of their achievements in science and technology (S and T). A nation's susceptibility to this yardstick of worth is all the more if it cannot take pride in accomplishments of a different sort, for instance, in innovative development strategies which benefit the masses and instil pride and the hope of a better tomorrow. Outclassed by the achievements of the west in S and T and overwhelmed by a sense of inferiority and defeat, peoples and communities then turn to their religious identity and to their past as sources of moral superiority and pride. This fuels fundamentalist revivals, such as those of the Islamic movements in Iran, Egypt, Pakistan, and Algeria; and of Hindutva in India.

According to Mohan, corrective steps should include encouragement of innovative need-based technologies as a counter to international yardsticks of world class technologies. Further, he says, India needs to promote indigenous technology in select areas where the country has a comparative advantage, so as to enthrone posterity with "hope and the desire to innovate", and counter "the sense of inadequacy and a feeling of defeat" that the invading global technologies of the MNCs bring in their wake. Indigenous technology must be distinguished from global technology. Elaborating upon this theme, Mohan argues that during colonial times, when technological products from the west were transplanted in its colonies, technology was truly global. In recent decades, however, there has been a trend towards the deglobalisation of technology. Urban buses in the low income countries (LICs) for instance, based on once global technology, cater to far greater peak loads than those in the high income countries (HICs). Likewise, the capital-intensive, low occupancy high speed trains of the HICs will not be affordable in the LICs for years to come. Diverging social needs and the development of indigenous capabilities underlie this deglobalisation of technology. The process needs to be

encouraged, with products that are becoming non-global identified and made the focus of innovative research and development.

PV Indiresan gives us a somewhat different perspective on the role of technology in society. Citing the New Economic Policy, Indiresan voices the concern that "...even if the economy fares better, social conditions are liable to get worse". Economic welfare and social justice require that increasing doses of market capitalism are balanced by investments in public goods, which, "...by definition are available to the poor as much as to the wealthy". Indiresan's paper concerns itself with how investments in one type of public good – transport and communication – can accomplish this by contributing to the development of rural areas and thereby attenuating the disparity between the village and the city. Rural-urban disparity, Indiresan maintains, stems from differences in 'connectivity', a term he defines as "...the number of people each citizen can connect to in a given unit of time". Given that the variety of services and high productivity jobs that a well-connected city supports depends on its level of connectivity, the question arises as to whether a rural setting with an equal degree of connectivity as a well-connected city will replicate the city's amenities, services and productive employment. On the assumption that it will, Indiresan proposes an efficient rural public transportation and telecommunications grid that will link India's villages to rural populations of the order of 400 to 600 thousand, approximately the numbers inhabiting such cities as Edinburgh, Frankfurt and San Francisco. Indiresan argues: "...it is not unreasonable to assume that this order of connectivity will be sufficient to support modern urban amenities in a rural setting; and that in such a case, rural areas too can develop as well as cities." The cost of the proposed grid, largely those of the transportation network and support services (as improving the number of lines available to a rural telephone connection at local rates involves chiefly administrative decisions and little additional investment), works out to Rs 1,00,000 crore. The investment would benefit 10 times as many people as the number that would benefit if the sum were used to upgrade metro services. To eliminate the disparity between the village and the city, it is also required that tele-ineffective services, those that should be available within walking distance (water, municipal services, etc) be provided in rural areas on par with corresponding amenities in urban settings.

These, then, are the contributions by the various scholars of the book. The perspectives they provide are, for the most part, varied articulations of a 'nay' to the New Economic Policy. The volume hopefully will fulfil its mission of stimulating nation-wide debate and discussion on the issues it highlights.

Dollar Empire: Logic of Decay

Frederic Clairmont

The punch-drunk dollar is on the ropes and its central role in the monetary galaxy raises crucial questions about the very survivability of capitalism. Five years after the collapse of the Wall where are the protagonists of the New Economic Order chanting the glories of unadulterated economic liberalism? The mythology of free trade has been torn to shreds. The logic of the dollar's decay helps us to understand why.

IN the wake of recent panic foreign exchange markets are looking for some beacon of hope and stability. But neither hope nor stability is on the agenda. At an accelerating tempo, the universe of finance capital in 1995 will continue to be one of chronic instability, fear, bankruptcies, massive job liquidations. Reverberations of the dollar's meltdown is far from over; a process that goes far beyond what the conventional economic wisdom would label 'a market correction'. The empire of the dollar and the financial galaxy in which it orbits is a ticking time-bomb.

The market shakeout and shakedowns in recent weeks have destroyed all semblance of international financial stability. There is nothing that augurs a return to 'normality'. NAFTA is on the ropes, the Canadian economy is buried in debt, bedevilled by a depreciating dollar. The mass capital exodus of billions of dollars from Latin America is on the march. What has amplified the dollar's implosion is that it coincided in time with the political and economic eruption in Mexico, the ignominious collapse of one of the most powerful pillars of the British financial establishment and worldwide financial destabilisation.

While the western hemispheric quasi-colonial currencies have been plunging vis-a-vis the dollar, the greenback, the world's major reserve currency, has been battered by two major imperial currencies. The precipitous fall in the world's leading reserve currency is a continuous function of the relative global decline of the American empire; it highlights the dynamics of inter-imperialist antagonisms that are ripping apart the already tattered fabric of the world economy. The dollar's debacle and the policies which engendered its pathology over the past three decades is fast approaching a day of reckoning. But of course the hapless dollar is not a solitary swallow.

DOLLAR'S MELTDOWN

The magnitude of the dollar's tumble since the onset of 1995 is staggering. But why should this momentous event come as a

surprise to so many in view of the absence of any international monetary discipline, signalled by the US sabotage of the Bretton Woods agreement? It will be recalled that the liquidation of the dollar gold exchange standard gave way to a floating exchange rate system. Or no system at all. No less so than national income aggregates, currency trajectories over time are fairly accurate barometers of a nation's economic health, or inversely, as in the US, of its inherent fragility.

What the graph reveals is that the greenback's woes vis-a-vis the two major imperial currencies were discernible before August 1971 – and this was one of the causal factors in the US scuttling of Bretton Woods. What the universe of Big Capital is experiencing is a crucial infection in the history of post-war international financial relations. The pervasively corrupt and wobbly structure of finance capitalism: banks, insurance companies, mutual and pension funds, foreign exchange markets and financial flows are cast adrift, buffeted by gigantic speculative tornadoes whose ravages are cataclysmically foreseeable. Only about 2 per cent of the more than one trillion dollars traded daily are destined for productive purposes. With the dollar leading the pack, banking and finance transactions are nothing more than a colossal crap game, played by mega financial institutions that are totally unaccountable to any national entity.

The dollar's meltdown is not fortuitous; in essence, it springs from the criminal rejection of every act of fiscal rectitude and budgetary prudence by the US money managers. At the very moment when the dollar's apoplexy was at its apogee the US Congress had the arrogance to reject the Balanced Budget Amendment. In short, the deficits will continue to pile up at compound interest rates.

Among the reasons for a stricken dollar, the free fall of the peso is not of central significance. More pertinent, however, is the perilously widening gap between savings and investment; differentials in interest rates and productivity; rising tidal

waves of current account and budgetary deficits wedded to profligate spending; national debt (\$5.1 trillion) spiralling into the stratosphere; a casino banking and credit system that is at once archaic and unjust, unable even to meet the minimum requirements of morally acceptable standards of national development. These are but a selection of formal quantifiable elements that comprise the dollar's pathology. Their lethal evolution will continue to have disastrous political reverberations both nationally and internationally. Let us peruse briefly some of the factors that feed the US caste oligarchy's delusions that it can live off other people's money indefinitely.

WHAT THE NUMBERS MEAN

US private, corporate and public debt once again hit record levels in 1994. The summit is not yet reached. The US requires a minimum of \$225 bn yearly to feed its deficits. This pinpoints the extent to which it is living off borrowed time and borrowed money, i.e., the world's savings. Its net savings rate measured 2.6 per cent of disposable income in 1994, sharply lower than the 9.4 per cent average for the 50s and 60s. Despite a record \$140 bn trade surplus the money to plug this deficit will not come from Japan. A Soga Shosha trader puts it bluntly: "I don't know what's going to be the bottom of the dollar: 90, 80, 70 or is it 50 yen or perhaps lower?" This query epitomises the depth of the empire's tragedy. The intoxicating 80s with money flowing in are over. In addition to the costs of Kobe's reconstruction, balance sheets of Japanese banks are still loaded with non-performing loans. This stems from the Bubble's burst in 1991, as well as the need to prop up a teetering stock market. Moreover many Japanese banks have been bled by the speculative fallout of Barings. But that's not all.

Japanese investors have been sizzled by the greenback's depreciation. These losses amount to a staggering \$430 bn since 1975. The same Mitsui trader indignantly asked: "Why should we invest in a currency whose money managers have trampled on their own currency?" Certainly Japanese investors will be putting their money into the US, but increasingly so on a short-term basis. Japan's corporate treasurers have already set their targets for other geographical regions.

By end-1994, the US current account deficit hit \$166 bn. According to one treasury estimate this is set to rise to \$190 bn in 1995. This figure must also be \$55-60 bn to bonds and equity markets in 1994 as well as net foreign debt obligations of \$600 bn. For a long time the slippage in overseas wealth was ignored. US income flows are now negative. On the premise that the trade

FIGURE: THE DOLLAR'S DECAY, 1970-1995

Source: Datastream

decifit, including transfers, remain at around 2 per cent of GDP, the outflows would build up rapidly. This means that the current account deficit would continue to climb and net foreign debt too. Where will the dollars come from to pay these charges?

A balance sheet has two sides: assets and liabilities. Interest rate charges and reimbursements are already absorbing a sizeable segment of federal revenues. Have the caste oligarchy forgotten the arithmetic of compound interest that comprises the repayment of both interest and principal? This ruinous national balance sheet would even be worse if interest rates rose and the trade balance further deteriorated. If the present movement continues, net debt is likely to hit 45-50 per cent of GDP by 2000.

What is so frightening in these appalling numbers is not simply the extent to which the US is simply living beyond its means – it has been doing that for a very long time – but also how rapidly the financial deterioration has occurred. Of course such heights of indebtedness are by no means unique to the US. Italy's public debt now stands at 120 per cent of GDP. Servicing this debt is already gobbling up nine-tenths of its GDP. Italy, another Mexico in the making, is well on the road to an even more crushing financial implosion.

WIDER CONTEXT

The cracking of the dollar must be seen within the context of global debt and exponential debt creation. Corporate,

household and government debt surpasses an estimated \$ 31 trillion galloping at a compound rate of about 9 per cent yearly. That's more than three times as fast as world GDP and trade. These disparate rates are unsustainable. This being so, at what point it may be asked, will the world financial bubble burst? Exacerbating this critical mass is the uninhibited liberalisation and concentration of capital that hit \$ 336 bn in 1994, surpassing the 1988 record of \$ 335 billion. These numbers relate exclusively to the US.

If this stride continues unabated the value of fusions, mergers and acquisitions would not be far short of \$ 12 trillion globally by the century's end. This is the numeric face of what I have categorised as the Corporate Economic Gulag (CEG). Or to put it another way: the sheer magnitude of this figure with its horrendous Gulagite implications – political and social – is that it represents more than twice the 1993 US GDP.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Because of the unsynchronised workings of world markets the bubble's bursting will not and cannot transpire at a specific nodal point in time. What may be said is that the bursting of Japan's bubble economy, the decomposition of Mexico's financial and political structures, the crumbling of the dollar, and the velocity of the Barings disintegration are merely the hors-d'oeuvre to the impending firestorm of an authentic Big Bang.

The dollar's quandary must also be related to burgeoning foreign exchange markets. In 1986, some \$ 290 bn were transacted daily on these markets; by 1990, they topped \$ 700 bn; by end-1994 they scaled \$ 13 trillion. This is Skullduggery Inc, as a Wall Street accountant facetiously described it. The racketeering of the world of finance capitalism at this juncture would make the mobsters of BCCI, the manipulators of the Savings and Loan Associations, the swindles of the Milkens and the Keatings look like a bunch of amateurs. This free-wheeling big time racketeering is happening hourly on foreign exchanges, 24 hours a day worldwide, gambling on the minutest of margins and raking in Big Money El Dorados (and losing them too) in split seconds with that commodity of commodities – money. This is happening not only on derivative markets but over the entire spectrum of finance capital.

IN SUM

The punch-drunk dollar as a currency is on the ropes, but its central role in the monetary galaxy raises crucial questions not only about the future trajectory of unrestricted mega corporates and liberalisation, but the very nature of the survivability of capitalism as it swings into the third millennium. Five years after the collapse of the Wall where are the protagonists of the New Economic Order chanting the glories immutable of unadulterated economic liberalism? The discredited ideologists of 'free trade' have run for cover. Their once thunderous voices have been reduced to an incoherent babble. The mythology of free trade – it was always a myth – has been torn to shreds. The logic of the dollar's decay helps us to understand why.

Studying Common Property Resources Biography of a Research Project

N S Jodha

An aspect of 'methodology' researchers rarely report are the processes and procedures they have to use while conducting research and disseminating its results. Here the author highlights the many hazards of conducting an unconventional but worthwhile research study.

I Introduction

THIS paper summarises my presentation at a recent meeting on emerging trends in conduct of applied social science research. This relates to the study of rural common property resources (CPRs) in the dry regions of India (1982-1986), which proved to be my most effective research in terms of its operational use by several agencies ranging from the grass roots level NGOs to national and international development agencies. Policy-makers and planners dealing with wasteland development, anti-poverty programmes, environmental problems in fragile resource zones and researchers from the areas as far-ranging as watershed management to resource economics have used the results and data of the study in different measures. At least six of the articles based on the work have been reprinted in the journals and books of readings nationally and internationally. This also prompted the initiation of a number of CPR studies in the country. Finally, the CPR research shifted focus of my professional work from agricultural economics to the larger issues of environmental resources, sustainability, and participatory development strategies. The effectiveness of the CPR study under question is due to the fact that it attempted to record and project some realities, which all of us routinely see and yet do not recognise. It provided data, insights, and analysis that helped to integrate the problems of rural poverty, resource access and environmental instability, which in turn form the mandate of several agencies grappling with the problem of rural development.

In this paper, I do not reproduce the results already reported. Nor will the formal methodology used for the study get undue attention. I will focus mainly on the processes and procedures through which I had to pass while conducting the research and

disseminating its message. This is one aspect of 'methodology' which researchers rarely report in their studies. I hope the following narration, besides amusing some, will enlighten many about the hazards of an unconventional but worthwhile research study.

II Genesis of the Study

As a background to the CPR research the following will be useful. During 1979-81, I worked in Tanzania for the International Institute of Tropical Agriculture (IITA). The year 1980 was a severe drought year for East Africa. Newspapers and others predicted famine, miseries and some deaths in Tanzania. As a part of the work on farming systems studies, we regularly visited some of the worst-affected areas in the country. The year passed and none died. The secret of people's survival was the sustenance-support they received from the village commons, which was invisible to both media and the statistical systems designed to cover rural situation. This induced me to reflect on the Indian experience, where a large majority of the poor people survive and multiply, despite their being below the official poverty line. Here too, despite their invisibility to statistical reporting systems, the CPRs play a significant role in people's economy and survival strategies.

When I rejoined International Crops Research Institute for Semi-Arid Tropics (ICRISAT), Hyderabad, after my Tanzanian stint, I proposed a study of CPRs in the dry regions of India. In the 'in-house review' meetings, where research proposals are debated and approved, every one from the director-general downwards (except my colleagues from economics programme) opposed the proposal. Reason: "being a crops research institute", they emphasised, "we have little to do with the CPRs(!)". Based on some past, scattered data on the contri-

butions of village pastures, forests, etc., to the village income and employment, I argued that in some areas, the rural poor derive as much as 25 per cent of their sustenance from CPRs. If the latter degrade and disappear, the prospective crop technology from ICRISAT will have to produce 25 per cent extra for maintaining the existing levels of living of such groups. The pleading fell on deaf ears, until the chairman of the governing board of ICRISAT, Bantley, a soil scientist by background, sitting in a corner as an observer in the in-house review, uttered a few words supporting my proposal. As a result, I was given one year to prove the relevance and utility of CPR research for ICRISAT's work. Incidentally, much after the completion of the study and widespread use and recognition of its findings, around 1989, when ICRISAT (like rest of the International Agricultural Research Centres dealing with crops) was under pressure to also address issues relating to environmental resources and sustainability, the above CPR study proved quite handy for them, to prove their long standing(!) concern for these issues.

TEETHING TROUBLES

I took the challenge to prove the relevance of CPRs for ICRISAT. We re-tabulated some earlier data on village pastures, community forests, village wastelands, watershed drainages, etc., which constitute CPRs in dry regions of India, but until then were never called as such. After publicising the inferences and concerns, generated by the initial work to selected agencies supporting rural research, we were overwhelmed by the response from agencies such as the United Nations Environment Programme (UNEP), Commonwealth Forestry Bureau, Canadian Climate Programme and the Ford Foundation. Governed by the experience of past projects I managed, that "more project money one has, more time one has to spend on managing money rather than doing substantive project work", I opted for the smallest of the offers. The Ford Foundation promised \$ 33,000 which covered the project cost as well as my salary and honorarium to my more than 60 small and big collaborators. Besides, the Ford Foundation proved extremely flexible in design and revisions of project as demanded by our emerging understanding of the CPR situation.

However, despite the above promise of support and seriousness on the part of the Ford Foundation, we had several slips between cup and lip. As per the ICRISAT-

GOI memorandum of understanding, the grant from any foreign agency to ICRISAT, does not have to pass through the process of government of India approval. However, by mistake the Ford Foundation submitted an approval request to the government along with the research proposal. Since the CPRs cover components relating to forest, water, pasture, watershed, wasteland and agricultural land, the proposal was made to shuttle between different ministries, as each of them finding the mention of subject covered by another ministry conveniently disowned the responsibility and passed it on to others for approval. It was a typical case of 'commons ownership implying no one's ownership'. Almost after eight months, the Ford Foundation withdrew the request for approval and made a direct grant for the study within a week.

This led to the second category of procedural hurdles. The study proposed to cover all dry tropical regions and was designed to be a collaborative effort. The ICRISAT administration insisted that as per the ICRISAT-JCAR (Indian Council of Agricultural Research) memorandum of understanding, the project collaborators should be the ICAR institutes or agricultural universities only. Besides, the non-availability of appropriate co-operators, this would have required ICAR approval, which as per the past experience of ICRISAT would have taken more than a year. Furthermore, there was strong suggestion for a rigid statistical sampling (violating the very spirit of the study as conceived) and collection of data using the ICRISAT's investigators, who through a prolonged engagement in collection of household and plot level data from the same farmers and villages for 10 years had become rather mechanical – and unsuitable for the CPR investigations. Thus at one stage the study seemed to be a non-starter.

However, a round-about solution was found, by treating the project as a special study conducted by the author for the Ford Foundation. ICRISAT was thus relieved of observing the aforesaid procedural formalities as well as paying my salary and project costs from their budget. I made the fullest use of the freedom and flexibility created in the process, as reflected in the methodology used in both the field work and target group focused analysis and reporting of the results.

III

Methodology: Mix of Unconventional Approaches

The study covered over 80 villages in 20 districts of eight arid/semi-arid tropical states of India. As a first step in the area selection, I identified or located the potential co-

operators for the study using my past contacts and association with the Draught-Prone Area Programme, the Agro-Economic Research Centres and the selected departments in regional universities. Once an appropriate collaborator was identified the area (around his/her residence or place of work) was automatically selected. The only condition was that such areas should fall within the broad soil and rainfall zones of dry tropical regions of India. This method of investigator-centred choice of areas was essential because CPR study required a close feel of the field and knowledge of the local oral history and current situation of the area. The study covered information on several sensitive issues. All this would have been difficult with pre-selection of areas and putting investigators as strangers in different areas. The study proved to be a joint effort of over 60 co-operators whose age ranged from 16-60 years, literacy level ranged from pre-school to PhD, they belonged to the occupational groups such as traditional farming, teaching, research, community work (e.g. NGOs), and students attending schools. Put together, they represented eight linguistic groups, but half of them could communicate in at least two languages.

The collection and verification of information involved a mixed use of methods employed by anthropologists and economists. Depending on the requirement, relevance and feasibility, the methods such as structured survey, group discussion, case histories and physical observations/measurements were employed. Much before the now popular methodologies of rapid rural appraisal (RRA) and participatory rural appraisal (PRA) were coined as such and acquired the limelight, this study employed these methods. It may be added that except for the essential common and basic information, all villages were not uniformly covered for each aspect of the inquiry. The choice in this regard was guided by the relevance and presence of the focused problem in the concerned village/area. In some sense, the field investigations were process and awareness driven. Accordingly, in the process of work (including the sharing of preliminary results) during the first two years, as we became aware of the new problems and possibilities, the same were added to the list of issues to be examined. This was a reward of the flexibility mentioned earlier. The primary data thus collected were supplemented by secondary data from the historical or current records as well as other village studies, particularly by ICRISAT and Agro-Economic Research Centres.

Since most of the data formed a mixture of qualitative and quantitative information on the current and historical situation of CPRs at micro-level, they were initially gathered using the diary method rather than

structured questionnaire. Most of the processing too involved examining each information and manually tabulating it for specific purposes. Consequently, most of the data could not be put on computer disks. On the insistence of my quantitative-oriented economist colleagues, I subjected some of them to regression analysis for a paper for a FAO meeting on rural institutional development in 1987. The discussant of the paper, a well known agricultural economist commented, "The author by using regression has ruptured the beauty of insights and understanding conveyed by the descriptive account of the CPRs in India." This was the end of the further desire for any quantitative analysis of the data. Hence, the large set of data relating to CPR units, households, villages and district/sub-district were analysed by simple method involving bi-variate tables. The relative simplicity and transparency associated with this method of information processing, proved to be one of the main reasons for appeal and utility/usability of CPR-study for NGOs and different development agencies.

Before, we comment on the key findings and their use by different agencies, a word on unusual difficulties faced during the fieldwork. Despite all the arrangements for fieldwork, etc., made according to our choice, the process of work was not obstacle free. Intimidation, threats, and physical harm to my field-level co-operators – at least in three villages, by those who had illegally grabbed CPR lands, was one constraint to smooth working. Equally problematic was the opposition by different village factions, who alleged us to be the allies of their respective opponents. The periodic logistic failures (as we only rarely used ICRISAT facilities unless it was very essential and not influencing our work style and rapport with the villagers), came up in different forms. However, a most significant threat came from the government of India.

In 1985, in the wake of the disclosure that foreign espionage agencies had a deep access to the office of the prime minister (Rajiv Gandhi), the whole atmosphere was surcharged with rumours indicating that CIA has its sources of information in several major institutions in India. Based on half truths and misinterpretation of facts supplied by some disgruntled element in the national staff of the institute, Press Trust of India (PTI) released a story nationwide, about ICRISAT's supposed participation in CIA activities in India. One of the examples in the CIA story referred to the information gathering on 'India's common property resources'. As a part of the enquiry teams from the government of India (which proved the PTI story completely baseless), a group came to interrogate me as the principal

researcher of the CPR project. As a preface to their questioning, the enquiry team stated the following: "India's common property resources are our heritage and wealth, they should be protected, and information about them should not be collected and publicised in the interest of the country. The foreign agencies, not interested in India's progress, can damage over common property resources." I responded to their concern broadly in the same words as used by the inquiring members, "Yes, common property resources are our real assets, and they should be protected, but we (governments) do not do so; we need information on them because we do not know about them and hence allow their degradation and decline. Information collected under the CPR study will help rural communities to develop and sustainably use them." In response to their next questions I explained that these resources include village pasture, community forest, village wasteland, etc. The committee members were shockingly embarrassed when confronted their own ignorance of CPRs. After a brief murmur about why CIA should be interested in India's community grazing lands, they

profusely blamed the PTI for a misleading story and closed the enquiry.

IV

Major Findings and Inferences

In order to give a feel of the findings of the CPR study, the following may be summarised: As reported through different write-ups (see bibliography), the study presented quantified evidence on economic and ecological role of CPRs in villages. Despite a rapid decline in their area, CPRs contribute to the sustenance of the people, especially rural poor. In some areas, the latter derive as high as 30 per cent of their sustenance from CPRs. The CPR-based activities in some areas offer more employment days in a year than the jobs offered by focused rural employment programmes. The income inequities tend to decline with the inclusion of CPR share in the household incomes. The performance of crop farming and adaptation to drought conditions is better in villages with a comparatively better CPR situation. CPRs represent the communities' institutional response to imperatives of fragile and risky environments. However, even when such

imperatives of fragile lands are unchanged, the extent, management and productivity of CPRs has rapidly declined over last four decades or so. In some areas, their extent has declined by over 60 per cent. The factors that have contributed to the decline of CPRs include the land policies of the states encouraging privatisation of CPRs; market forces, technological changes, and population growth (which in association with the public policies) have marginalised the role of group action in communities. However, despite general decline, depending on the local circumstances, such as persistent utility and productivity of CPR units, resilience of traditional forms of rural co-operation, etc, CPRs are still sustainably managed in some cases. Such cases offer useful leads for proactive CPR policies and programmes. Despite the recent changes encouraging privatisation, the case for protection, sustainable development and use of CPRs seems much stronger. This is because of the following reasons: marginality of most of the bio-physical resources in dry areas make them more appropriate for CPR status (pasture, forest, etc); CPRs can play potentially a very important role in anti-

SAGE PUBLICATION

INTERPRETING WORLD POLITICS

edited by KANTI P BAJPAI and HARISH C SHUKUL

This volume brings together conceptual and substantive essays on both the practice and theory of international relations by Indian and Western scholars. Organized around four themes central to the understanding and conduct of world politics in a new era, the papers in the volume look at perceptions about and concepts concerning world politics (international relations theory); the goals, rules and institutions within which world politics is conducted (international society); the primary operating environment of states (regional politics); and how states regulate their mutual relations (foreign policy).

Combining theoretical and methodological concerns with "real world" problems and issues and bringing together distinguished contributors from all over the globe, this volume will be of immense interest to those studying international relations, world politics, political science, and defence/strategic issues.

POLITICAL THEORIES

AND SOCIAL RECONSTRUCTION

A Critical Survey of
the Literature on India
THOMAS PANTHAM

How do the liberal-democratic, Marxist, Gandhian and Hindutva theorizations of Indian politics differ from one another? How have those differences been explored by Indian and/or India-oriented social and political theorists? These are the central questions addressed by Professor Thomas Pantham in this comprehensive survey of the literature on the major political theories relating to the restructuring of Indian society.

One of the main features of the book is its critical survey of the ongoing and prolific debate between the nationalist-Marxist and subaltern-Marxist schools of Indian historiography concerning the politics of social transformation in colonial and post-colonial India.

poverty programmes; complementarity between CPRs and private property resources (PPRs) is an unrecognised source of high and stable agricultural performance, and lessons from success stories of CPR-management can be replicated elsewhere. Recognition and utilisation of CPRs as a component of rural development strategies, however, will need reorientation of the latter.

The need for reorientation of rural development strategies apart, the message of the study did reach some of the promoters of CPR-based activities. Depending on the nature of their tasks and relevance of specific results, nearly a dozen agencies have examined and considered the inferences of CPR study, including through my personal involvement in their deliberations. A few of them included: the Indian Planning Commission, while deliberating on the prospects and strategies for bio-mass fuel supplies during the Eighth Five-Year Plan; National Wasteland Development Board (NWDB), while designing approach for micro-watersheds, and also while projecting problems and prospects of fodder supply during the Eighth Plan; the ministry of environment and forests, while assessing the processes of resource degradation in different zones of India; ministry of agriculture, while deciding on future approaches to small ruminant (sheep and goat) development; UNICEF (Delhi), while evolving training material to strengthen food systems in tribal areas; NGOs such as Agha Khan Rural Support Programme (AKRSP) Gujarat, Society for Promotion of Wasteland Development (SPWD), Development Alternative, and several grass roots level, small NGOs in Rajasthan, Gujarat and Andhra Pradesh, in the course of designing the work and training programmes. In some of the study villages, which I had a chance to visit after analysis of data, sharing of inferences from the study, helped in a sort of introspection and led to initiation of group action to rehabilitate the selected CPRs. To this, we may add the teaching and research community. Their interest in the CPR study is reflected through requests for and reprinting of the nearly half a dozen original articles in books and journals, national and international. Besides, a number of students in India and abroad used the data and inferences (as hypotheses) of the CPR study for their research work. The examples are more than one would have expected as impacts of a single study.

Since the study covered multiple aspects of community resources, it had a potential for use by diverse interest groups. If quoted out of context, it could be easily misused for supporting contradictory orientations. I will present only two cases to illustrate the point

where, in one case the study is used for supporting the cause of the poor, while in another it proves anti-poor.

While reading *in absentia*, my paper on the role of market forces in eroding CPRs, in a seminar in the US, the speaker said, "Marxist like Jodha(!) says so and so..." In another meeting at NWDB, while deliberating on the possibility of handing over wastelands to private firms for development (as in Brazil), the supporters of the idea denied the poor people's stake and interest in the wastelands. As a proof they quoted evidence from the present CPR study, which reported that most of the poor households, dispossessed the CPR land distributed as private land to them by the government. However, they conveniently and purposely blacked out the remaining part of the story, namely, the poor mortgaged or sold out the land because such marginal land without complementary resource support could not be developed and used.

Perhaps due to the essential time lag involved, the study attracted more attention from researchers and research supporters four or five years after the end of the fieldwork. Besides, requests for borrowing the data, suggestions for supporting a second round of fieldwork in the same villages came from some donors. However, I had left ICRISAT in early 1987 to work at International Centre for Integrated Mountain Development (ICIMOD), Nepal, with an intention to return soon. Except some already tabulated information, all the field data files on CPRs were left at ICRISAT to be used on my return. This could never happen, as I decided to continue at ICIMOD and left ICRISAT for good. In 1991, I was exploring the possibility of second round of CPR study through someone and wanted to lend data files to some students. At that stage, I learned that the boxes containing CPR data could not be located at ICRISAT. In their process of periodical cleaning of the data store, the boxes containing CPR data were perhaps consigned to the wastepaper drums for recycling. In the process, we lost not only a comprehensive set of data but also a benchmark to compare the CPR situation in 1990s as against 1980s.

On the Beaten Path

A K Pat

Dimensions of Monetary Expansion in India by Amitava Mukherjee; Himalaya Publishing House, Bombay, 1994; pp 227, Rs 225.

AMITAVA MUKHERJEE's book is perhaps the latest addition to the evergrowing literature on the theme of monetary policy and money supply process. This book occupies a slot somewhere between a textbook and a work of original contribution to this area of economics. Most of what this book has dealt with, has been said, analysed and discussed earlier. Its contribution lies then in the manner in which all the different related issues have been brought together at one place.

The book opens with a chapter devoted to a brief overview of the banking structure in India. It is believed that an understanding of the nature of the banking system is essential in developing a framework for evaluating the behaviour of proximate determinants of the money stock. In effect this portion stands apart from the rest of the topics and has not been properly enmeshed. Furthermore, the statistics on many of the banking indicators presented here are dated. One could make do without this chapter. This is followed by an extensive discussion on the theory of money supply and its proximate determinants. The chapter while discussing the monetary base model takes us through a labyrinth of equations and contains a restatement, and an uncritical one at that, of S B Gupta's analysis of the inter-relationship of different constituents. Very many equations have been developed for analysis of proximate determinants of money stock, but a few have been used in the analysis.

For a study of currency ratio behaviour and characteristics, the reference period, 1951-52 through 1990-91, has been divided into six subperiods. The rationale of this subdivision has not been spelt out. It would have been useful if the influence of various factors on currency movements in different subperiods was econometrically quantified for conclusive results. At one place (p 91) the author states that lower increase both in currency and demand deposits in 1985-86 could be attributed to, among other factors, the relative price stability, availability of more attractive financial assets, measures to check the growth of black money, etc. He goes on to add, "this receives further corroborations from the fact that domestic

savings as percentage of NNP at current market prices fell between 1984-85 and 1985-86 but aggregate net investment as percentage of NNP at current market prices increased whereby indicating a shift in public preference in favour of other investments such as small saving instruments, government securities, capital investments bonds ...as against cash or deposits with banks". This statement defies comprehension. Does the author mean savings in India comprise only cash and deposits? Is the author ignorant of the fact that aggregate net investment or capital formation is the sum total of savings (not as defined by the author) and net inflow of foreign resources? When total savings are inclusive of an array of financial assets mentioned by the author which of course finance net investment in the economy, how does the difference in the saving and investment ratios 'corroborate' the shift in household preference away from currency? Should we not use other methods to establish it? The section on contrast with the developed countries in the matter of currency ratios is superficial and pedestrian. Why 'income' and 'urbanisation' did not exert influence on the currency ratio should have been subjected to a detailed examination. Further the use of the subtitle 'contrast' is questionable as no such attempt has been made.

The chapter discussing the behaviour of the reserve ratio again divides the reference period into six sub-periods of roughly six years each, without giving an explanation for such a choice. The author seems to have worked out reserve ratios, incorporating the figure of 'other deposits' with RBI in the total deposits. This is a faulty method leading to abnormal results because the RBI does not indulge in credit creation like commercial and co-operative banks; it only provides reserves to the banking system through extension of loans and investment activities. The author's understanding that non-scheduled banks need not hold required reserves and that non-scheduled banks are beyond the reach of the Reserve Bank in the matter of required reserves is wrong. The cash reserve requirement for non-scheduled banks is laid down in section 18 of the Banking Regulation Act. It is admittedly

less stringent than what is applicable to the scheduled banks. It is not clear whether the author has made a distinction between legal reserves and free reserves in the analysis of the trends in reserve ratios. The substitution effect, advanced to explain the movement in reserve ratio (p 94), became invalid way back in 1962 when the distinction between the demand and time liabilities for the purpose of reserve requirements was removed and the reserve ratio was uniformly prescribed. And how does change in SLR requirements as well as interest payable on CRR affect the cash reserves held by banks (p 102, para 2)?

The chapter dealing with the behaviour of the reserve ratio is descriptive of the policy measures implemented. The result of the exercise to study the relationship of the reserve ratio with demand deposits, aggregate deposits and total reserve was that none of this had a perceptible influence on the former. Which factor, in fact, exerted influence on reserve ratio apart from legal requirements? There is no evidence of any statistical assessment of the effect of interest rates on bank reserves in the relevant chapter, but in the summary and conclusions the author has made a summary statement that "available evidence cannot corroborate the hypothesis of elasticity of reserve ratio with respect to rate of interest, set out by Pollock and White".

The sources of monetary base changes, the nature of reserve money and its behaviour are discussed in the chapter that follows. Changes in monetary base are attributed to endogenous and exogenous or autonomous factors. The latter are monetary authorities' (including government's) transactions with the rest of the world and as such the 'initiative' lies with the former. Endogenous changes are determined by the public and the banks, through their borrowings from the Reserve Bank and the foreign exchange transactions of the non-bank public. Therefore in the author's opinion the assumption that the monetary base is autonomous or policy determined is incorrect. It is hard to accept the author's argument that all borrowings from RBI is at the initiative of banks and development banks for the reason that ability of the banks to borrow from the RBI is by and large dependent on the credit policy stance prevailing from time to time; RBI determines even the extent of availability of refinance from it. Similarly, the author is of the view that bills of exchange and treasury bills rediscounted by the RBI from the commercial banks should be reckoned as RBI credit to banks and not to the com-

mercial sector or government. The reason behind the procedure presently followed by the RBI could be that once the bill is rediscounted, the RBI becomes 'holder in due course' and in the process of rediscounting it has stepped into the shoes of the original holder. RBI offers a sort of refinancing facility earlier extended by the banks to their constituents. As such the 'prior party' to a negotiable instrument is liable to the 'holder in due course'. Of net bank credit to the government and deficit financing, the author's impression that one rupee coins (central government currency) are not considered in the measurement and computation of net RBI credit to government is incorrect (see p 30 of *Report of Money Supply Working Group*). A portion of government currency (i.e. small coins) to the extent to which it is held outside RBI, is, however, not included in RBI credit as the small coins are distributed through small coin depots in exchange transactions and their issue to the public directly does not constitute 'deficit financing'. In exchange transaction the level of currency does not undergo any change but only the composition. The need for making a distinction between 'old' issues and 'current' issues of government securities to arrive at the current year's deficit financing as measured by RBI credit to government, as suggested by the author, was never in question but perhaps the RBI could not give effect to it in the monetary statistics compiled by it because of difficulty in making such a fine distinction at the operational level. The findings of the penultimate chapter on interaction of the determinants of money stock are the same as those thrown up by earlier studies, such as a decline in the influence of the money multiplier because of significant rise in reserve requirement and concomitant increase in the contribution of reserve money to change in money supply, etc. The author concludes the book on an optimistic note that the role of the multiplier is likely to increase in future considerably because the currency ratio might fall due to the popularity of alternative financial assets. Will his expectation materialise, given, on the one hand, the huge size of black money, the growth of which is relentlessly encouraged by the kind of social structure and widespread political and bureaucratic corruption, and disintermediation on the other. The author has endeavoured to add value to his book by incorporating 27 appendices containing statistical data. The tables have not been coherently and thematically presented. Some are irrelevant, e.g. Tables X and XI, and are not referred to in the text. The period coverage of statistics on different dimensions is not uniform. A few individual years are left blank in many tables. The veracity of

the data presented in Table XXV is suspected as figures do not tally with those given in official publications such as the *Report on Currency and Finance* and the *RBI Bulletin*. In short no attention has been paid to neat and accurate presentation of authentic data.

As one finishes reading the book one cannot help the feeling that the author has missed a good opportunity to shed light at least on a few new dimensions of monetary

expansion in India because of his proclivity to tread the beaten path. A senior professor of economics once remarked to this reviewer that monetary economics was largely institution-based. Therefore academics who do not interface with policy-planners in the central bank and with practitioners of banking can never get to know the nuances and subtleties of the subject and to that extent their knowledge would be incomplete. This book reminded me of the professor's remark.

Russia: Change with Continuity

Anuradha M Chenoy

Rethinking Russia by Madhavan Palat and Geeti Sen (eds); India International Centre and UBSPD Publishers, New Delhi, 1994.

THIS collection is a pastiche made up of a delightful combination of Russian art, film, history and politics. Yet it avoids being an 'everything-you-wanted-to-know-about-Russia' volume. What makes it especially striking are the reproductions of Russian art, both traditional and contemporary, the use of poetry, and photographs which intersperse the pages. But the lavish use of visual techniques does not make this a coffee table reader – the text ensures a serious and analytical examination of aspects of Russian culture and politics. Brought out initially as a special issue of the *India International Centre Quarterly*, this volume represents India's continuing interest in Russia.

The question of continuity and change is a recurrent theme in this volume. Much has changed and much appears to be the same. Much that has changed seems to have reverted back to the past. But this is deceptive because history does not repeat itself. For example, the nomenklatura were purportedly pushed out of power, after Yeltsin's accession to power following the August coup. But the results of the post-1993 elections show the links of the nomenklatura with the new mafiosi and their influence on the leadership in Russia, and in the other regions of the former Soviet Union. Besides, the impact of the old system on the political parties and other social formations show that there have been sharp elements of both continuity as well as discontinuity. The 1917 revolutions (February and October) marked sharp discontinuities with the earlier regimes. But there were also continuities. The October Revolution slogan of 'land, peace and bread' was designed to incorporate liberal bourgeois demands. Towards the end of his life, Lenin admitted this in his writings on the New Economic Policy.

Palat's essay, 'Russia as the Alternative Universal', analyses the modernisation process of Russia since the late 18th century.

Modernisation, he argues, proceeded along capitalist lines despite the constrictions of a backward agricultural sector and a society which continued to be organised in a hierarchy of estates with a set of regulations right up to 1917. The Soviet regime, in Palat's thesis, continued in its drive towards modernisation, inheriting the mantle of the Russian ethos of leading one camp in the divided world. This was the essence of the alternate to the European route to modernity offered by the Russian empire and its intelligentsia. The symbioses of the past with the present made Russia different, and it is the continuity that Palat stresses.

Clearly, there was not just one stage in Russian/Soviet history. This is what Mikhail Gelfer stresses in his conversation with Dev Murarka. Nor was there just one kind of politics. Several kinds of politics contended. In each phase, one type struggled for and came to dominance. In each stage social goals, policies and power structures varied. And when one regime was displaced or replaced by another, there was a discontinuity. The Russian society moved from one transition to another. The Russian revolution was, according to Lenin and Stalin, a transition to socialism, which according to the latter was achieved in 1936 after the civil war and the purges. As various historians like E H Carr and Isaac Deutscher have shown, even this transition was incomplete. The Khrushchev interregnum, the aborted Kosygin reforms, Gorbachev's attempts at change were all unfinished agendas. Under these circumstances sweeping generalisations are misleading, and over-ambitious predictions are likely to become outdated.

In Russia not only theories get outdated. Political figures too, as Trotsky said, get swept into the dustbin of history. Alexander Tsipko sees a similar fate awaiting Zhirinovsky. Evidently, some of the nationalist tendencies represented by Zhirinovsky

with the concomitant urge for hegemonism over a lost and not so distant empire, have been appropriated by Yeltsin himself. This is shown in Anatoli Lieven's analysis of Russian relations with its 'near abroad'.

In his detailed analysis of party formation and the Russian political system, Hari Vasudevan analyses leadership rhetoric (mainly of the Democratic Russia Party) to understand politics. Vasudevan feels that comparative analysis is inadequate for studying the kind of politics at play. However, comparative politics is required to situate the problem historically and sociologically. What kinds of politics dominate or decline, are a product of larger socio-political conditions. Rhetoric may not adequately bring out the ideological and real shifts that take place. This fact is recognised even by conservative, not to speak of liberal political theory. Thus, if viewed in comparative perspective, certain patterns in political processes can be found in Russia and the CIS where revolutions have failed (or been 'betrayed') and socialism has become the longest road to capitalism.

The failure of the revolution remains an enigma to many, especially on the left. Dev Murarka views that the revolution was betrayed by the Russian intellectuals. But other contributors like Mariam Salganik, A Tsipko and others, belie this assumption by the strength of their work. If anything, the Russian intelligentsia is divided, especially after the siege of the parliament of September 1993. The division of the intelligentsia parallels what is happening in Russia. Society, as a consequence of the economic reforms, is being divided into rich and poor, and regional variations are on the increase. Mikhail Geffer finds, as a result, most of the intellectuals cynical and indifferent. This attitude is evident in Dev Murarka's interview with Mikhail Gorbachev, an important contribution in this volume. Here, Gorbachev has distanced himself from his place in history by referring to himself in third person. He states, "As far as the reform goes, the party should have been put in its place, to be only a party, a public-political organ and not interfere with the functioning of the state". This reflects his idealism rather than a clear understanding of the role of the CPSU through history. But this is typical of Gorbachev's speeches, ambiguous, full of generalisations, even about civilisational tasks. And yet, Tatyana Tolstaya, a writer and the grand-niece of Leo Tolstoy, has remarked that intellectuals when they drink, toast Gorbachev even today. "They drink to Gorbachev the way they drink to lost youth, to first love (even if it ended in betrayal)... Because life was good then. Because he unclenched his fist and let go of East Europe and eased our collective consciousness..."

(*The New Republic*, April 11, 1994). Yet this toast is incomplete, because Gorbachev unclenched his fist over the Soviet Union itself. Because, as Rousseau and Marx have stated, no people who oppress others can themselves be free.

Mariam Salganik's article on the plight of the Russian woman, caught in the paradox of ideology, male chauvinism and history makes poignant reading. Several professionally competent articles on Russian icons, Tarkovsky's films, Dostoevsky, etc. analyse Russia's search for self-identity.

Arup Banerji has contributed a well-researched piece on private farms in Russia. He outlines the legal changes and their impact on private farms. However, even with decollectivisation there exists a plurality of forms of property in Russia, necessitated by the diverse conditions. It would be abnormal to have just two or three types of farms in Russia. The private farms can be compared with other types of farms. Interestingly, laws to encourage decollectivisation in Russia have had contradictory effects. For instance, the Decree on Taxation of February and December 1993, was linked with the sale of land. In 1992-1993, the tax on land was 10-144 roubles per hectare. The price of land

was established at 50 times the land tax, which did not reflect the market value of land. This was done to encourage the resale of farms, which is leading to a reconcentration of land ownership. While decrees are purportedly designed to facilitate the transformation of large farms to smaller ones, the reverse is taking place. Thus, while Banerji discusses the trauma of collectivisation drive of the 1930s, it must also be stated that the current phase of decollectivisation is by no means less cataclysmic.

Of course, like any good Indo-Russian collaboration, this volume also contains a 'down memory lane' conversation with the two great stalwarts of the Indo-Soviet days, Nikhil Chakravarty and A K Damodaran. The links of the early communist movement with the Soviet Union are reconstructed, and the intricacies of Indo-Soviet relations recorded. Joan Robinson had once said, "everything you say about India is true. And the opposite is also true." This aphorism could also be extended to the former Soviet Union. This perhaps remains the basis for the continuation for Indo-Russian ties, and volumes such as these.

NEW AGE INTERNATIONAL PUBLISHERS

ECONOMIC JUSTICE IN A FREE SOCIETY

Gautam Mathur

The book explores and refines the concept of distributive justice in a truly democratic society. The author has developed an original framework to address the fundamental concerns in ensuring economic justice in society.

81-224-0604-1 1994 Cloth 293 pp Rs. 350

THE THEORY OF INTERNATIONAL VALUES

Rajas Parchure

The book makes an appeal for a thorough restatement of the theory of international values. It integrates the 'pure' and 'monetary' aspects of international economic relations, and formulates a multicountry multicommodity theory of trade.

81-224-0664-5 1994 Cloth 250 pp Rs. 300

Universities as Institutions

Andre Beteille

An institution is not just a social arrangement with a certain form and function; to survive it must also have a certain legitimacy and meaning for its members such that they are willing to put its demands above their individual interests, at least some of the time. This paper explores the question of whether, by this definition, the University of Delhi, or any university or college in India, can be called a functioning institution. Practically every university has entered the process of stagnation and decay, not least because of the total politicisation of academic life and loss of purpose in an institution whose basic aim is the pursuit of science and scholarship.

I WOULD like to discuss the university in contemporary India as an institution. Conducted with proper care and attention, such a discussion might open a window onto many aspects of Indian society today. An institution is a social arrangement that has not only a certain form and function but also a certain legitimacy and meaning for its individual members. Its form and function are what we may observe from outside; but viewed from within and by its members, what count for as much, if not more, are questions of meaning and legitimacy.

I

The life of a society, if the metaphor be permitted, is in a significant sense the life of its many and diverse institutions. Sometimes old institutions decay through loss of legitimacy and meaning even though many of their morphological features survive. The opposite may also be true; a new social arrangement may be given the outward form of an institution, but it will not function as one if its members find little or no inner meaning in it. Let me repeat an observation I have made elsewhere [Beteille 1992]: an institution is not simply any social arrangement, but one which has a certain meaning for its members such that they acknowledge its moral claims on them and are willing to submit to its demands, at least some of the time, even when they find those demands to be contrary to their individual interests.

By the test I have just proposed, is the University of Delhi an institution? Is St Stephen's College an institution? The direction of my enquiry should be clear. St Stephen's College – or, for that matter, any college in the University of Delhi – has the external characteristics of an institution. Those external characteristics are of very great importance and have to be carefully observed and described. But we have to move beyond that to the other question: what does it mean today for a student or a teacher to be a member of a college or a university department in Delhi?

It is difficult to answer the questions I have posed without entering into the details of the everyday life of the university, its colleges and postgraduate departments. But before I attempt to do that, I would like to place those questions in a wider social context. A large and complex society such as the Indian one has a highly differentiated institutional system: there are many different institutions in it, some securely established, others on their way out, and yet others struggling to become established. These last have become a source of concern to many in India today. The present exercise may be regarded as an attempt to give expression to this widely-felt concern from the sociological point of view.

The transformation of Indian society since the middle of the 19th century has been associated with the growth of a large number of public and semi-public institutions that are either new or differ substantially from those that prevailed in the past [Beteille 1991]. The new institutions differ from the old not only in their morphological forms but also in the values that give them meaning and legitimacy. To be sure, India had institutions of learning in the past, but a modern college such as St Stephen's – or a modern university such as the University of Delhi – differs from those both in its external characteristics and in the norms and values by which its members are required or expected to abide.

Independent India set itself the objective of economic development within the framework of a democratic political system. Whether one stresses the plan or the market, and whatever combination of the two one recommends, there can be no sustained economic development in the absence of appropriate institutions; and unless there are effective institutions to mediate between citizens and the state, there can be no democracy in any meaningful sense. The old social arrangements inherited from the past can no longer meet all the demands of economic efficiency, and even less those of good citizenship. It is said by one and all that the old hierarchical and paternalistic

values have become obsolete. But the new values that are to replace the old ones cannot exist, still less act, in a vacuum; they need new institutions for their sustenance and expression.

I would like to stress here the variety of institutions and the importance of this variety for a dynamic economy and, even more, for a democratic polity. A democratic polity requires not only parties and other political institutions, but different kinds of these that are to some extent in competition with each other. A dynamic economy requires not only banks and other financial institutions, but a variety of these to offer services on competitive terms. The same argument may be extended to educational institutions. Schools, colleges, universities and other educational institutions are not only different from political and financial institutions, but they also differ among themselves. Today, one of the advantages of the American university system over the European is that the former accommodates a richer variety of institutions, 'private' as well as 'public', than the latter.¹

Institutions have in general a longer life span than individuals. Sometimes they decay over time and become attenuated or even extinct. Or they change and adapt themselves to the changes taking place in the wider society. For example, the Indian family is changing and likely to change further, but it still remains recognisably the same kind of institution despite these changes. I may refer here to the universities and colleges in Europe. Some of these are medieval foundations, going back to the 12th and 13th centuries. The universities have changed enormously over time but can still be recognised as universities today. The fate of the colleges has been somewhat different. The University of Paris, one of the two founding universities of Europe, had a number of important colleges in the past, but they all disappeared in course of time [Rashdall 1936; Stone 1974]. In Oxford and Cambridge, on the other hand, the colleges made a more successful transition from medieval to modern times, and, though

vastly different from what they were in the past, they remain active as institutions to this day.

The integration of institutions, whether of the same kind or of different kinds, is a complex and difficult subject into which I cannot enter here. It is sufficient to note that many different kinds of institutions – old and new, traditional and modern, sacred and secular, private and public – have in fact co-existed in one and the same society at different times in different places. To be sure, institutions may be mutually incompatible, but their incompatibility has to be established not so much by applying formal rules as by examining the historical record.

Finally, we have to remember that, although every institution demands some loyalty from its individual members, the same individual is characteristically – and not incidentally – a member of several institutions. For instance, a permanent member of a college is typically, though not universally, also a member of a family and sometimes a member of a church or some other religious institution as well as a member of a party or some other political institution. Here again, the conflict of demands may sometimes be acute as, for instance, when the same individual is a member of the Catholic Church as well as of a communist party, but both individuals and institutions are capable of a great deal of accommodation in these matters. In the past, in Cambridge and Oxford, domestic life was considered incompatible with the life of fellowship in a college, so fellows were not permitted to marry. For instance, the economist Alfred Marshall had to give up his fellowship of St John's College when he married [Pigou 1956]; but the demands of the college on its fellows eased somewhat over time, and it is no longer considered necessary for them to remain celibate. What is more, St John's College now admits women to its fellowship, a development that Marshall would have deplored.

II

I would now like to take up for consideration universities (and colleges) as institutions characteristic of modern India. Their importance in the modernisation of Indian society – its economic and political transformation – hardly requires emphasis. At the same time, I would not like to claim any pre-eminence for these among other institutions such as courts, legislatures, parties, banks, hospitals and so on, that are also a part of the modern Indian scene. If I select a particular kind of institution, it is because I believe that I can present my argument best by a close examination of a single type, and I know academic institutions a little better than most other institutions.

Universities and colleges in India are modern institutions. Unlike domestic and religious institutions, they do not derive their sanction from 'immemorial tradition'. Since universities and colleges as academic institutions typically pride themselves on the antiquity of their traditions, the fact of newness is important. Most parts of the University of Delhi, including the majority of its colleges, have come up in the last two or three decades. The university itself came into existence in 1922, although its two oldest colleges both belong to the end of the last century. It is sometimes felt that in contemporary India universities and colleges have expanded too rapidly and too haphazardly under demographic, political and other pressures to enable them to create secure institutional foundations for themselves.

Delhi University has emerged as a large and sprawling institution with many parts that do not fit together or appear to fit together harmoniously. No proper history of it exists, and it is difficult to give even an adequate description of it in sociological terms. Yet the transformations undergone by the University of Delhi in the last 40 years might be a subject of great interest to the sociologist and the social historian concerned with the study of social change in modern India.

The two principal component parts of the University of Delhi as an academic institution are the colleges and the postgraduate departments. There are in addition halls of residence, libraries, laboratories, statutory bodies such as the executive and the academic councils, and separate departments dealing with administration, examinations, finance, and so on. The different parts of the university have grown unevenly, some very rapidly, and Delhi University is losing the unity and coherence it had in the 1950s. An important aspect of the university as an institution is that its individual members – whether students or teachers – should have some sense of it as a whole. Not many persons can say confidently or honestly that they have such a sense about Delhi University today, and in that regard it is now different from what it was 40 years ago and what the Jawaharlal Nehru University still is today.

The growing loss of identity in the University of Delhi is due in part to its great and rapid expansion, but there may be other, deeper reasons as well. The individual colleges and post graduate departments, though perhaps not all of them, retain a larger degree of self-identity, and they are in any case the principal seats of teaching and research in the university. Today one gets a better sense of the life in an academic institution by examining a college or a postgraduate department than by trying to look at the university as a whole. I must point out that there is nothing inconsistent in

speaking of the University of Delhi as well as any of its colleges as institutions, since institutions are often nesting systems in which the fundamental features of the whole are replicated in the parts and sub-parts.

In their foundation, the colleges are prior to the university, not only in Delhi but also in Calcutta, Bombay and Madras where the first three modern universities were established in India. In Calcutta, throughout the 19th century, the centres of academic life, where students and teachers met and interacted, were in Hindu College (later Presidency College), St Xavier's College and the Scottish Churches College rather than in the University of Calcutta [Banerjee et al 1957]. Lord Curzon noted this lack of institutional focus in the University of Calcutta, then the premier university in the country. He observed, "How different is India! Here the university has no corporate existence...it is not a collection of buildings, it is scarcely even a site. It is a body that controls courses of study and sets examination papers to pupils of affiliated colleges" [Government of India 1971:498].

Attempts were made in the early part of the 20th century to make good the deficiency by creating a focus of institutional life in the universities of Dacca, Benares, and later Delhi. Lord Curzon's observation on the absence of buildings and building sites was taken to heart. The idea that every university must have its own campus has now come to be generally accepted. In post-independence India, the establishment of a new university has generally been associated with much building activity. But campus and buildings may be necessary to give the university an institutional focus, they are not sufficient. In any case, the new university soon outgrows the buildings with which it started, and the regularity with which they are allowed to run down is a symptom of the university's inability to find and retain its institutional focus.

The older universities were set up to be examining bodies rather than bodies of scholars engaged in study and research. Attempts to change this began in the early part of the present century. The University of Calcutta took the lead under the vice-chancellorship of Ashutosh Mukherji by creating strong post-graduate departments in the arts and sciences [Banerji et al 1957]. It became the centre of a vigorous intellectual life in the 1920s through 1940s, but lost its focus soon after independence. The University of Delhi came into its own as an institution in the 1950s and 1960s, but has now entered a phase of decline. There are many reasons behind this, but here I will only point to the constant threat to the institutional focus of the Indian university from the pressures of certification. Examinations are no doubt important, but when a university subordinates its other

concerns to the concern for certification, there cannot but be a loss of institutional focus.

The University of Delhi, like the Universities of Calcutta, Bombay and Madras, conducts hundreds of examinations and awards thousands of degrees, diplomas and certificates every year. It is believed, though difficult to prove, that large and growing numbers of students enrol themselves in the University of Delhi mainly if not solely in order to secure its degrees. One cannot say how widespread this tendency is, but where it becomes the general pattern, the university will, despite campus and buildings, become what the University of Calcutta was when it started, an examining body with little or no corporate existence.

III

Today it may be easier to find a corporate identity in the colleges, or at least in some of them, although these may be in a minority among the thousands of colleges that now exist in the country. I shall turn presently to the social side of this corporate identity, which is its most important aspect, but before that I would like to make a few observations on its physical locus.

While going through the history of St Stephen's College, I was struck by the continuous concern of the authorities to provide the college with buildings of its own [Monk 1935]. The college started in rented premises but soon moved to its own buildings near Kashmiri Gate in 1891. There was no University of Delhi then. Shortly after the new university was established, the college, which became affiliated with it, began making plans for buildings on the campus, but it took a couple of decades for it to move into its present location. St Stephen's College is by common consent one of the few physically attractive places remaining in the University of Delhi, although there were several such places only 30 years ago. Few colleges in India have the resources of St Stephen's; nevertheless, the others might have done a little better, if they had cared a little more for their institutions, about the maintenance and upkeep of their premises.

Why is the physical aspect of a college important? Certification and even formal instruction in the classroom are only a part, and perhaps not the most important part, of the life of the college as an institution. A college is above all a place for the interchange of ideas on every conceivable subject among teachers and students, and that interchange cannot be effective without long and continuous interaction. To be sure, those who are driven by the passion for ideas will make a place for their expression anywhere. But I am talking about institutions and not exceptional individuals, and the task of the institution is precisely to provide its ordinary

members with a setting that they find both physically and socially congenial. A college which is physically incongenial will be unlikely to keep its ordinary members longer than is minimally required by the rules of attendance. As we know very well, that requirement, for both students and teachers, has turned out to be remarkably elastic.

I now move from the physical to the social, and start with Curzon's lament about the lack of a corporate existence. We might ask in what sense a university or a college may be regarded as a corporation. I do not wish to enter into technical legal questions, but we might consider the celebrated dictum of Henry Maine – incidentally, one of the early vice-chancellors of the University of Calcutta – that “Corporations *never die*” [Maine 1931:104, emphasis in original].

Of course, Maine knew very well that it is not literally true that a corporation cannot die; what he wished to convey by the phrase was a sense of the enduring identity of the corporation, or its capacity to outlive its individual members. I can be reasonably certain that St Stephen's College – or even the University of Delhi – will not cease to exist in my own lifetime. But there is more to it than that, for one can see the college extending into the future and retaining its identity even after all its present members have been replaced by new ones.

Every institution must have the capacity to maintain its collective identity despite the continuous replacement of its old members by new ones, but that capacity is particularly manifest in the university and the college. In the typical case, the students greatly outnumber the teachers. Between a third and a quarter of the former leave the college or the university every year and are replaced by new ones. The student body of the college today is completely different, or almost completely different from the body five years ago; yet it is the same college. Teachers have a lower turnover, and that is why they have an appearance of permanence whereas the students appear as transients, although in the long run, or from the viewpoint of the institution, everyone is a transient.

A college or a university derives many of its distinctive features as an institution from its characteristic age-structure. It differs from all the modern institutions to which I have earlier referred by virtue of the predominance of the young. The relations between the generations is of great significance in every society, and especially in one in which important changes are taking place.

Changes are taking place not only in social relations and in attitudes and values, but probably also in the very meanings that people assign to youth and age. I will make my point with a rapid digression. Many years ago, I was taken aback to read in a very popular textbook on social stratification

“that in American society one is generally considered better, superior, or more worthy if he is ... Young rather than Old” (Tumin 1967:27). That did not correspond at all with my understanding of my own society, but I soon realised that the meanings assigned to youth and age are neither invariant nor unchanging. If those meanings are changing today, there is no public domain in which the change can be more easily observed than in the college or the university.

The same textbook on social stratification observed that one is generally considered better, superior, or more worthy if he is “Male rather than Female” [Tumin 1967:27]. Here, by changing themselves from within, the universities and colleges have played a crucial part in introducing changes in attitudes and perceptions throughout society. The universities were predominantly, if not overwhelmingly, male institutions until very recently, not only in India but everywhere. Removing the restrictions on the admission and appointment of women and their incorporation into the institutions of higher education have been among the most significant changes of the 20th century. Towards the end of his life, Edmund Leach, known for his radical views as a young anthropologist but later criticised for joining the establishment, said in an interview that it was after all while he was provost of King's College that women were first given admission into that bastion of male privilege [Kuper 1986]. He wished to be remembered for the part he had played in that outcome, and, I believe, with good judgment.

Young men and women unrelated by ties of kinship and community can interact more freely in the university than perhaps in any other domain of society. If it has done nothing else, it has at the very least created a new basis for the relationship between men and women in contemporary India. In the past, whether among Hindus or Muslims, the life led by women was either hard or confined, or both, and that is probably true for most women even today. It is mainly in the college or the university that, as a young adult, a woman can enjoy a little freedom to explore new social relations and to construct a new social identity. In the past, in all social classes a woman was already burdened by the cares of domestic life by the time she was 17 or 18 today, if she has the luck to enter university, a new life might open up for her at that age. The university has provided a new ideal of womanhood even if only a handful are able to give that ideal a concrete shape.

Success in academic competition creates a new sense of confidence in women, although we must not exaggerate the extent of change that this can bring about in the actual relations between men and women. Ours is in many ways a deeply conservative society, and conservatism takes its most

obdurate form in the attitudes of men towards women. Academic and other achievements do not automatically bring about equality in social relations, and women are reminded at every turn of their subordinate position in society and its institutions. Yet, I believe that it speaks well of our colleges that here in Delhi the best women undergraduates prefer mixed colleges for their study to colleges only for women.

IV

I now turn, though only briefly, to the thorny question of institutional hierarchy. I have spoken deliberately of the inequality between men and women in order to point out that, although it is pervasive in Indian society, it is neither necessary nor desirable in an academic institution. If the college cannot remove or reduce the inequalities in the relations between men and women that its members bring into it from the wider society, it fails as an academic institution to that extent. But that does not mean that all forms of inequality can or should be removed from the college. Certain forms of it are constitutive of an institution as a stable arrangement of persons engaged in a set of co-ordinated activities. But the inequalities constitutive of, say, the family are not the same as those constitutive of the college; and certainly the inequalities inherent in the institution of caste – and also those largely accepted in our traditional institutions of learning – can have no place in a modern college or university.

I would like to draw attention, and that too, briefly, to only two sources of inequality characteristic of the college or university as an institution. The first is associated with the regulation of activities and the maintenance of discipline; and the second with competition and its outcome. Every institution must take steps to ensure that its daily tasks are smoothly performed and must therefore invest some of its members with more authority – and also more responsibility – than others. It is difficult to visualise a college in which teachers and students – or even the principal, the senior teachers and the junior teachers – all enjoy equal authority. It can be easily argued from general principles that the co-ordination of the wide range of differentiated activities that take place in a college – and even more in the university as a whole – requires some regulatory mechanism which in turn requires some inequality in the distribution of authority [Beteille 1977].

Discipline in any institution is maintained largely through internal sanctions without the use, or even the threat of punishment. Where the use or the threat of punishment becomes the usual rather than the

exceptional method of social regulation, one might hesitate to speak of it as an institution. No institution can work without some exercise of authority, but the constant exercise of authority leads to a loss of its legitimacy, and where authority loses its legitimacy, the institution is bound to decline.

A university or college is a place of achievement through success in free, if not always fair, competition [Beteille 1987: 157-84; 212-32]. It is also a place of academic distinction; or at least its members are expected to strive to make it one. This means that it must not be apprehensive of inequality as such, but be prepared to accept those forms of it that follow from the application of the criteria that it values. It must take the responsibility of sorting the good students out from the bad ones. Above all, it must not be afraid to distinguish between bright, capable and enthusiastic teachers and those who are dull, incompetent and lazy. A university will fail in its essential responsibility to discriminate among students according to academic standards if it refuses to apply those standards in discriminating among its teachers.

One cannot speak of the university or college as an institution without confronting the question of academic standards. There cannot be any fixed or invariant standard of academic excellence and, above all, it cannot be imposed on the university from outside. Universities and colleges differ enormously in their resources, both material and human, and one cannot speak of academic standards without reference to those resources. A college with modest resources cannot maintain the same academic standards, in absolute terms, as, say, the University of Chicago. But the two institutions can both maintain the same high standards, in relative terms, if they use their respective resources with equal care and imagination.

What matters in the end for the institution is not whether it achieves academic excellence but whether it values it. Even our best may not be as good as the second-best in some other institution, but we must not for that reason fail to discriminate among those that we do have. A college thrives on the enthusiasm of its students, and that enthusiasm is smothered if they are all treated alike, irrespective of quality or performance.

Teachers should be prepared to apply academic standards rigorously and impartially not only to their students but also to themselves. The academic selection process is central to the life of an academic institution which is threatened whenever that process is called into question or loses its credibility. It is a fact that there is today in the University of Delhi, as in most Indian universities, pervasive mistrust of the integrity of academic selection committees. That mistrust, irrespective of the grounds on

which it is based, strikes at the very heart of the meaning and legitimacy of the college and the university as academic institutions.

How extensive is the lack of integrity of academic selection committees in India today? Let me say at once that the facts are extremely difficult to establish, for, to quote Max Weber's ominous words, "No university teacher likes to be reminded of discussions of appointments, for they are seldom agreeable" [Gerth and Mills 1946: 133]. It is true that academic selection committees make mistakes, but it is not true that those mistakes are always made because they act in bad faith. Although they do sometimes act in bad faith, the greater fault with academic selection committees, in my limited personal experience, is not their corruptibility but their conservatism. I have rarely been able to persuade a selection committee to recommend a younger candidate with less experience and fewer publications against older and more experienced candidates with more publications, even when we were all agreed that the younger candidate had greater academic merit than all the others.

More and more people seem to believe that there is something subjective, hence arbitrary, if not capricious, about all judgments of academic merit. It is therefore better, they say, to go by 'objective' criteria such as seniority, class of degree, and number of publications in making academic selections. In the end, they tend to settle for what is, after all, the most objective criterion, namely, the length of service measured in years, months and days, irrespective of the quality of that service. The academic selection process is then reduced to a routine which has the advantage of administrative convenience, but deprives it of all meaning from the academic point of view.

The fear of exercising and being subjected to academic judgment is rationalised by the argument that academic distinctions, like all distinctions of rank, are invidious. I have heard persons in prominent public positions say that such distinctions are a legacy of colonialism, or a form of elitism, and ought to be abolished. Many a pillar of our academic establishment has learned to mask intellectual timidity by the use of populist rhetoric. Neither the timidity nor the rhetoric augurs well for our universities and colleges, for no academic institution can be sustained on the ideology of levellers.

The passage from growth to stagnation and decay has been repeated with almost unvarying regularity in practically every Indian university and in most colleges. What is more, the time taken for this passage appears to be getting progressively reduced.

When I left Calcutta where I had been a student in the University College of Science to join the University of Delhi as a teacher, the contrast between the two institutions made a great impression on me [Beteille 1990, 1995]. Calcutta is India's oldest university. Although it was founded in 1857, it began to function as a centre of postgraduate study and research only in the early years of the present century, and it soon acquired a reputation throughout the country. But by the late 1950s it was already in a state of decline. The authorities had failed to look after the physical upkeep of its buildings, libraries and laboratories, and protests, demonstrations and strikes were beginning to undermine the regularity and routine of academic work.

In the late 1950s, Delhi University was in the ascendant. It had the advantage of having a proper campus which the University of Calcutta lacked. It appeared both spacious and well-maintained, and teachers and students were moving into it from all parts of the country. But within 20 years it had outgrown its capacity to maintain itself, and the contrast between Delhi University today and as it was in 1959 is as great as that between the universities of Calcutta and Delhi at that time.

Today the predominant impression of the typical Indian university or college is one of disorder and apathy. The two reinforce each other. The disorder is most clearly visible when large numbers of persons congregate, especially during protests and demonstrations, but it is also seen in the confusion over admission procedures, examination schedules, and even teaching time-tables. A common response to the disorder in an institution is withdrawal by its members, and very few institutions tolerate absenteeism to the extent that universities and colleges do among teachers as well as students. There are not only students who attend courses fitfully and intermittently, but also, and increasingly, many professors who are professors only in their spare time.

Every college and university has an administrative staff, and some colleges are in fact well administered and maintained. Universities are generally larger, and their administration and maintenance more difficult. Moreover, academics set a high value, at least in principle, on 'academic autonomy', and the university is organised in such a manner that much of the responsibility for its administration and maintenance rests, at least formally, with the faculty. But increasingly, the members of the faculty are unavailable for that kind of routine work because of lack of time, or lack of interest or lack of energy.

Beneath the surface of apathy and disorder there is an undercurrent of aggression that finds expression in periodic outbursts. A factor that contributes to these outbursts of

aggression is that among all public institutions, the universities are the ones that are most open and exposed. For one thing, the university campus is frequently and increasingly invaded by what are euphemistically called 'outside elements'. Moreover, the university brings together socially heterogeneous components, men and women, and persons of diverse castes and communities. As I have observed, for some women, the university is pre-eminently a place of freedom, and in our fundamentally conservative society, this is deeply resented by many men and also by some women. Again, it is not very easy to adjust to the redefinition of the social relations among persons from diverse strata that the university or college necessarily demands. In popular writing on the university, all the attention is paid to the acute forms of aggression as manifested in campus violence, and hardly any attention is paid to its chronic forms. Yet these chronic forms of aggression have in the long run a debilitating effect on the life of the institution that tends to escape the notice of even its concerned members.

Very few colleges in India retain an aesthetically pleasing appearance, and I cannot think of any university as a whole that does so.² Peeling walls, broken window-panes, leaking taps, unswept corridors and filthy toilets meet the eye everywhere, and the sad thing is that teachers and students become so easily inured to the dirt and decay. The university authorities say that they cannot do very much since they are hamstrung by financial cuts which become more acute every year. There is no doubt a problem of financial shortage, but even more acute is the problem of managing and husbanding scarce financial resources. University authorities appear at one and the same time helpless when it comes to augmenting income and profligate when it comes to spending money.

The university campus is aesthetically unattractive partly through neglect and lack of care, but also on account of deliberate and wanton misuse of its spaces. Furniture is broken and window panes are smashed not only on occasions of collective outbursts, but as a matter of routine by individuals letting off steam. Outer walls and even inner ones can never be kept clean, since it is the clean ones that are specially targeted for political slogans and moral exhortations. Another expression of this kind of aggression is the defacement of books and periodicals that has become endemic in virtually all university and college libraries.

The chronic aggression finds expression in the surly tone habitually adopted by students 'karamcharis' and teachers whenever disagreement has to be expressed in public. I will say little here about students but confine my observations to the employees of the university. First, there are the

specifically political occasions, such as strikes, rallies and demonstrations, when discontent is aired and demands presented in the most violent language, not only by karamcharis but also by teachers. No doubt the tone of anger is often simulated, but it is infectious. Here, a decisive change has come about in the culture of university and college teachers in the last three decades. Vice-chancellors and principals are often singled out for the choicest abuse by the leaders of the teachers' movement; I have been told that there is nothing personal in this, it is just the political culture of the mass movement from which the university cannot remain isolated.

Violent and abusive language is not confined to strictly political occasions, as when trade-union leaders negotiate with the authorities. I can speak from experience about the academic council of the University of Delhi, and from hearsay about similar bodies in other universities. I will say nothing of the level of academic ability displayed in the discussions, but only about their tone. That tone is now marked by a conspicuous, even deliberate, lack of civility. At meetings of the academic council, those professors who still value civility as a virtue sit silently for most of the time, and quietly slip out as soon as they can decently do so. Many scholars and scientists have begun to feel that it is no longer possible to participate in the decision-making bodies of the university and maintain their self-esteem.

The persistent abuse of vice-chancellors, noisy scenes in the academic council, and the generally uncivil tone of public discussions violates the dignity of the university as an institution. It is not enough to be mindful of the dignity of individuals, we must also be mindful of the dignity of institutions. In India people took great care in the past of their traditional institutions, particularly their domestic and religious institutions. When the first universities and other modern institutions came up in the 19th century, there was some sense of their dignity, and the need to preserve and nourish it. That sense seems to be now evaporating. This is only another symptom of the loss of meaning and legitimacy which I set out to discuss.

Successful professionals in India – scholars, scientists, doctors, architects, accountants, and others – tend to attribute the apathy and disorder in the institutions in which they work to the malign influence of politicians. There is no dearth of examples of unscrupulous interference by politicians in appointments, promotions and transfers in practically every kind of public institution, and few will deny that our political morality has reached a very low ebb. But there are many issues here that cannot all be despatched by being self-consciously virtuous. Politics is not just

something 'out there', the creation and instrument of a separate species called 'politicians', who act on professional pursuits only from outside. It has come to lodge itself within our universities, laboratories, hospitals, and other public institutions.

If by politics is meant the use of power to achieve particular ends in accordance with certain accepted codes, it is difficult to see how public institutions can be wholly insulated from it. Scholars, scientists, doctors and others who are quick to condemn politics in public life often fail to acknowledge their own involvement in activities that are also a form of politics.

If the university is to be a self-governing institution, it must make room for some form of politics within it. The lofty attitude to politics adopted in public by many scholars and scientists is misconceived, and it is often hypocritical. As institutions, universities have always been jealous of their autonomy, and their leaders have needed political support both within and outside to protect their autonomy in the face of threats from church, state and other powerful agencies. No one who cares for the university can say that its autonomy does not have to be fought for, or that it can be defended and strengthened without any regard for politics. What is true of the university as a whole is true also of its individual parts, for faculties, departments and colleges also need to protect their autonomy from unwanted and unjustified intrusion by the powers in the university, and that too cannot be done without engaging in politics in some sense of the term.

Having said all this, one must also say that the politics of the university need not, perhaps should not, be organised in the same way as the politics of legislatures, parties and trade unions. Democratic politics requires for its sustenance not only a certain kind of political constitution but also a certain kind of political culture. In a country with a rich intellectual tradition but no democratic institutions, it was hoped that the universities would play a leading part in the creation of that culture. They have on the whole failed to do so. Today, academic politics is not an example for the politics of the wider society, it has allowed itself to be swallowed up by that wider politics. Leaders of teachers' unions have not enhanced their own dignity or the dignity of the university by becoming petty instruments of the Congress(I), the CPI(M) and the BJP. And they could hardly protect the autonomy of the university by surrendering their own autonomy to their parties.

Today, the problem with academic politics in India is that it is all politics and hardly academic. Few leaders of teachers' unions have any credibility as scholars or

scientists, and many of them are indeed teachers in their spare time. Academic politics today is about 'empowering' teachers for securing better pay, guaranteed promotion and easy conditions of work; it has lost all connection with the content of science and scholarship. Universities ought to have representative even elected bodies in which some amount of political bargaining is to be expected before decisions are reached on academic issues. Academic issues hardly figure in the political bargaining that takes place in organs of the university with a large elected component. Those issues are now not only neglected, they provoke derision from activists among teacher politicians.

Vice-chancellors, deans, principals, and occasionally even leaders of teachers' unions say that the universities have been undone by politics, but by politics they generally mean what other people do, not what they themselves do. They also say from time to time that the government should step in and cleanse the universities of politics, but they say so without much conviction, for they know at bottom that such intervention is more likely to increase than to reduce the part played by politics. Embattled vice-chancellors turn sooner or later to political instruments in order to contain the political forces by which they see themselves threatened. They try to befriend ministers and officials on the one side and leaders of the unions of teachers, karamcharis and students on the other, hoping perhaps to use the one against the other, but ending frequently, and perhaps deservedly, as victims of both.

When an institution becomes politicised beyond a point, every problem in it seems a political problem, and no problem seems solvable except in political terms. The head of a university has to spend most of his time and energy in dealing with politicians and officials from outside, and leaders and representatives from within. He cannot, even if he wishes to, spend much time in discussing academic subjects with scholars and scientists, and not many vice-chancellors appear even to wish to do so. In this way, university vice-chancellors come more and more to resemble precisely those adepts in the art of the possible who appear to be their worst adversaries.

Politics cannot be expelled from the university or from any institution that values self-governance. At the same time, it cannot determine the agenda of an institution whose basic aim and purpose is the pursuit of science and scholarship. There are some who believe that the university can be set back on its natural path by a single decisive political act that will expunge all corruption and all injustice from it. That is a mistake. Every living institution has to accommodate some corruption and some injustice as a part

of its ordinary existence. The real challenge is to remain loyal to the ideals of science and scholarship in a world that offers other and more immediate attractions.

Notes

[This is a revised version of the second of the two Sudhir Kumar Bose Memorial Lectures on Institutions delivered at St Stephen's College in February 1992. I am grateful to the authorities of the college, and in particular Rajinder Gupta for the invitation to deliver the lectures and for their hospitality during the occasion. I would also like to thank Veena Das who chaired the two lectures for her observations and suggestions at that time and subsequently. In particular, it is due to her persuasion that I revised the second lecture for publication here.]

Authority, Gender and Knowledge

Theoretical Reflections on Participatory Rural Appraisal

David Mosse

Information for planning is shaped by relations of power and gender and by the investigators themselves, and certain kinds of knowledge are often excluded. Participatory methods of research such as participatory rural appraisal (PRA) are increasingly being used to overcome the limitations of conventional research methods.

THE popularity of techniques of participatory rural appraisal (PRA) in rural research and project planning comes in large part from their ability to generate information at the community level directly with members of the community. Such information is held to be more reliable, more efficiently obtained and more relevant to community interests than that generated by conventional social research methods [Chambers 1983, 1991]. Improving both the quality of information available to planners, and communication between outsiders and community members, is central to the rationale for participatory approaches, at least for projects with a more 'instrumental' notion of participation where PRA has made major in-roads. Many development efforts are set in highly complex social and physical environments which place a premium on the use of people's knowledge and judgments (e.g. in assessing new technologies). Access to this knowledge presupposes intensive interaction between project staff and members of the community. Techniques of PRA not only draw on the complexity and sophistication of people's technical and social knowledge and their practical expertise in livelihood management, but also bring out hitherto unrecognised abilities of diagrammatic and symbolic representation among informants through a range of mapping and diagramming techniques usable by non-literate peoples [RRA Notes 1988-92]. The effectiveness of location-specific project strategies based upon local knowledge equally depends upon the quality of information feedback and learning, and for this PRA increasingly finds successful application in methods of project monitoring and evaluation.

Given the growing importance of rapid research methods in development planning of all kinds, there are surprisingly few theoretical and critical reflections on methodology, particularly reflections from field experience [cf Fairhead 1991; Pottier 1991; Scoones and Thompson 1992]. In this article I draw on my recent field experience of PRA arising from work as a consultant to a participatory natural resource development project in a tribal region of western India. This provides the background for more general critical comments on some of the assumptions implied in the practice

of PRA. My focus here is particularly on the social context of the use of PRA methods, rather than on the individual techniques themselves. PRA is undertaken in many different social contexts, at different stages in a project's life, and by different types of development organisations. These obviously shape the fieldwork and bring to light different questions. This article focuses on the use of PRA at the very earliest stages in a project, that is prior to the setting of specific project objectives. We consider interdisciplinary 'team PRA's undertaken in an area which is new to the project organisation and at the point at which the project is developing its identity and relationship with local communities. This situation raises particular issues.

The first issue concerns the extent to which the use of PRA depends upon established links between an agency and local communities. Much work on PRA methods has been done by NGOs who are able to build upon years of work with a given community and have, themselves, an established identity and credibility. Is it possible for PRA to be undertaken in completely 'new' areas, where an agency is unknown? Can PRA itself be a means of establishing the mutual trust and rapport which is necessary for any participatory development effort? The second issue concerns participation in PRA. At its simplest level the question is, who does and who does not participate in organised PRA sessions? A more complex question is, are the perspectives and knowledge of all sections of a community equally 'accessible' to the methods of PRA, or are there features of the PRA methodology which impose a selectivity on the type and sources of information? I will look at the constraints to participation and the way in which PRA may generate (or create) information of a rather special kind. I suggest a view of local information and knowledge itself which differs from that commonly held in practice. Information does not just exist 'out there' waiting to be 'collected' or 'gathered', but is constructed, or created, in specific social contexts for particular purposes. Here I am concerned with PRA techniques organised as public events and the ways in which these create (and exclude) particular knowledge.

Specifically, I shall look at the implications of (1) social dominance and authority, (2) gender relations, and (3) the existence of project 'outsiders', for the shaping and recording of public information available for planning. In the case of gender, for example, the question is, what assumptions does PRA make about women's ability to fully participate? How 'accessible' is women's knowledge and experience to existing PRA methods?

The third issue to be addressed is the complicated question of the existence of different kinds of knowledge, and the problems this may pose in generating information for planning. A related question concerns the extent to which PRA remains a set of techniques by which outsiders extract information rather than a methodology for planning in which local actors actively participate. Is there an assumption, in the practice of PRA, that community knowledge about livelihoods and knowledge for action are the same? Does PRA in practice deal with the problem of the limits of local knowledge and awareness and the need for new skills for community analysis of problems and for planning?

CONTEXT

The experience of PRA which informs this paper comes from an Overseas Development Administration (ODA) funded natural resource development project, the Kribhco Indo-British Rainfed Farming Project (KRIBP), implemented in India by the Krishak Bharati Co-operative (KRIBHCO). A brief sketch of the project is necessary to set the background for the later discussion. The overall aim of the project is the promotion of a participatory and poverty-focused approach to farming systems development. The more specific objectives are to increase local capabilities in the management of natural resources and to improve the ability of the poorest to gain access to existing government programmes in order to bring about sustainable increases in farming systems production and improved socio-economic conditions of poor farming families. The project strategy involves an extended process of participatory planning in which PRA plays a part in generating location-specific natural resource develop-

ment plans. This involves prioritising problems to be solved and identifying opportunities for innovation. These include the use of improved crop varieties, measures for soil and water conservation, agro-forestry, minor irrigation and pisciculture. The project specifically aims to identify women's perspectives on farming systems, to strengthen women's existing roles in natural resource management, and open new opportunities for women's involvement in household and community decision-making and resource control. The sustainability of the project's initiatives ultimately depends upon the continued involvement of the community in project implementation, record keeping and monitoring. The project aims to generate a local capacity for this through the training of workers from the community and the development of village-based organisations. In the long run this aims to enable community-based provision of services (e.g. savings, credit or inputs supply) and management of common property resources (grazing, forestry, fisheries) [Centre for Development Studies 1990].

The project is located in the Bhil tribal districts of western India (Panchmahals in Gujarat, Banswara in Rajasthan, and Jhabua in Madhya Pradesh). These tribal districts are amongst the poorest in India. A rapidly growing population – presently around five million people – is putting increasing pressure on a fragile resource base which now faces extensive deforestation, soil erosion, water scarcity and declining agricultural productivity. Unable to meet their subsistence needs, 40-60 per cent of the working population now migrate seasonally for work in urban or better-off rural areas. Six village clusters have been identified for work in the first year, and the number is to expand subsequently.

The project is managed by a functionally autonomous specially staffed unit of the main organisation with its headquarters in the centre of the project area. A core of technical and social science specialists support male and female community organisers (COs) based in individual village clusters. COs have the responsibility of working with community members in developing local strategies for natural resource and organisation development and of making themselves redundant after two or three years by transferring skills to local workers.

In July 1992 COs took up residence in the village clusters following an extensive field-based period of training (including training in PRA methods, in which several already had considerable experience). They began by developing a general understanding of the locality and identifying suitable points of entry into the community. This involved village meetings, house-visits, sketch mapping, understanding local transport links, etc. and regular team meetings to review progress over the first two months. By the

end of two months, several villages had been identified as appropriate and ready for introductory PRAs. Positive criteria for selection of villages were small size, social homogeneity, the absence of known factionalism, the existence of supportive village leadership, and the interest and willingness of the village to host structured PRAs.

The purpose of the first PRAs were: (1) to provide further training for the team, (2) to contribute to the process of rapport building, (3) to develop and adapt PRA methodology for work in this area and stage of the project, and (4) to begin to meet the project's information needs. The PRAs involved teams of 8-10 people (headquarters staff, COs and supporting consultants, including myself) staying in villages for up to four days and collecting information with community participants using a range of techniques: village and area mapping; matrix ranking (e.g. of crops and trees); institutional linkage diagramming; kinship mapping (genealogies); seasonality diagramming; etc. Arrangements were made for our stay in the villages, sometimes making use of existing public buildings (e.g. schools) or hiring a canopy, organising food and cooking and occasionally lighting. The PRAs followed a general pattern. Following introductions in a general village meeting in which the purpose of the PRA is explained, a group settlement mapping is organised. This is followed by other group activities such as 'time-line' (local history of events or significant changes) or 'kinship mapping' (drawing genealogies). Villagers are then organised into three to four groups for the area mapping which usually takes place on the second day. Each group undertakes a 'village walk' spreading out in different directions from a central place. The group conducts interviews with households falling within their 'sector'. The area covered is then mapped by the group and presented at a plenary village meeting. These maps are used to identify areas of concern which are discussed and agreed upon in a village meeting. The third day is used for a range of other group exercises: tree matrix ranking, chapatti diagrams, seasonality diagramming, etc. Undoubtedly, there are many ways of organising PRAs, but the above pattern of public group activities is fairly common. When, in what follows, I refer to 'a PRA', I am referring to this pattern of activity.

The first two PRAs – undertaken in villages in Rajasthan and Madhya Pradesh – had very different outcomes. In one village (Chatra Khuta in Rajasthan) a good deal of agro-ecological and socio-economic information was generated with a good degree of community participation. Initial anxieties were overcome, the outsiders were welcomed, a context was created in which the project and its objectives could be explained, and PRA exercises proved effective at articulating locally perceived

problems in relation to soil erosion, deforestation, indebtedness, education, etc., and indicated likely directions in which to explore solutions. Watershed mapping, for example, was used by farmers to plot possible areas for soil and water conservation measures, and likely costing in terms of labour inputs for different types of work were generated. In the second village (Khatama in Madhya Pradesh), by contrast, the project team was prevented from carrying out the PRA by villagers who refused co-operation. The team was unable to establish a basis for communication with the community. Initial anxieties about the project deepened and the team had to leave the village after a day without having seriously attempted any information generation. In the process, significant lessons about this village and the PRA methods were learned. The experience of these two villages places in sharp relief issues which have been experienced more widely in the use of PRA at the opening stages of the project. The contrast between 'success' and 'failure' is more apparent than real in the sense that many of the underlying difficulties are in fact common to both successful and problematic participatory rural appraisal.² The rest of this paper reviews these issues.

PRA AND RAPPORT BUILDING

How easy was it to introduce PRA methods at the very outset of the project, and did these indeed help develop rapport with local communities? 'Rapport' is itself a very difficult quality to identify. The term describes a relationship between outsiders and the community, and implies the trust, agreement and co-operation necessary for the pursuit of participatory approaches to development. However, this relationship is usually described from only one point of view – that of the outsider. 'Effective rapport' in practice often represents the set of assumptions that outsiders have about the 'accessibility' of villagers and the likelihood of effective communication with them. In the case of the project, in the absence of agreed criteria and indicators, quite different assumptions were made by different people in relation to signs of 'good rapport'. Some field-workers emphasised participation in village meetings at which the project objectives were explained, others stressed the strength of links with, and co-operation of, local leaders, others pointed to the extent of household visits made. Several early problems in using PRA in the project were in fact related to mistaken assumptions and misread signs of 'rapport'. In practice, communication of the project's identity and gaining acceptance of its intended activities as a basis for undertaking PRAs, proved to be a complex process. The following paragraphs indicate the nature of the problem.

Several early experiences in the cluster villages indicated that tribal villagers

responded to project staff, not as welcomed helpers, but in terms of their recent experience of outsiders and present anxieties. In these tribal villages, contacts with new outsiders appear generally to be perceived as threatening and risky, rather than as offering new and welcome opportunities and resources. The most common anxiety concerned land rights. It was feared that the project would undermine land rights by constructing dams and flooding valley land, by reclaiming encroached government land for tree plantation, or by acquiring land for industrial development – all part of the tribals' recent negative experience of 'development'. In this context, the terminology used to express project intentions had to be chosen with care. Phrases such as 'forestry' or 'water resource development' conjured a history of experience which prejudiced local reactions to project initiatives.

The experience of generations of tribals in the area is that outsiders expressing concern with their affairs do so in order to pursue their own specific interests. These interests, moreover, are usually expressed in terms of meeting the tribals' own need for 'development'. In some of the project villages, villager scepticism was only deepened by statements (by project workers) that specific project objectives had not yet been set because villagers would themselves determine local development goals. Paradoxically, participatory rhetoric of this sort can be a bar to effective communication where seen as a devious refusal by outsiders to state their intentions plainly. The participatory approach contradicts experience and usually prompts local inquiry and conjecture as to the project's 'real' motives. The question uppermost in villagers' minds, and to which project staff have had to offer a satisfactory answer, is, 'who are you, and what is your interest in us?' Communicating an acceptable answer to this question in an appropriate idiom is a precondition for other rapport building or information gathering activities (e.g. PRA).

But do not the unthreatening situations created by PRA activities create an appropriate context in which to explain project objectives and open dialogue? Certainly, the effectiveness of PRA as a research method is often considered to rest on the 'rapport' generated by the creation of informal contexts (staying with people, sitting at the same level, etc). Experience from the project, however, suggests that where deeply entrenched suspicion of the motivation of outsiders' development intentions exists, participatory styles of interaction often do not have the effect of allaying fears and suspicions. The effect may in fact be near to the opposite.

First, it is easy to forget that notions of informality are culturally specific, and that what is apparently informal and unthreaten-

ing for project staff (e.g. sitting on the ground with villagers, or entering into casual conversation) may be seen as suspicious and deviant behaviour by tribals. This suspicion is illustrated by the comment of a woman in the Madhya Pradesh village, 'Today you are sitting on the ground, tomorrow you will be sitting on our heads'. Non-directive and consultative approaches are unfamiliar, disorienting and treated with suspicion by tribals whose interaction with outsiders has for years been characterised by prejudice and hierarchy. In fact, as I suggest below, PRAs often involve setting up contexts which are in social terms highly formal, and this has important implications for the kind of information generated.

Second, certain PRA methods, however sensitively employed, may themselves be misconstrued and may not help communication. In some circumstances the paraphernalia of PRA research – paper, charts, coloured papers, etc – may in fact generate a greater sense of mystification than conventional research methods. Given insecure land tenure among many tribals in the project area, for example, any emphasis on land – and particularly techniques of area mapping, transects, etc – may only serve to confirm existing anxieties about project intentions. Moreover, specific techniques such as village transects or mapping may superficially resemble the actions of other professionals – notably land surveyors for industrial development – and cause alarm. In these circumstances PRA methods have to be selected and used carefully.

Outsiders' initial sense of 'rapport' with a community is often derived from their interaction with a limited number of individuals who serve as the brokers or mediators between themselves and the community. Misperception of the social position of these 'community leaders' is another source of communication failure with implications for future project initiatives. In one or two situations in the project, the failure adequately to understand local styles and patterns of leadership seriously affected efforts to conduct PRAs. In the Madhya Pradesh village from which the team was excluded, the importance and influence of two different types of leadership within the tribal community was misperceived. Community organisers (COs) had developed contacts with individuals whose apparent influence rested on their well developed connections beyond the village. These included the holder of the statutory position of panchayat sarpanch. These leaders – who also presented themselves as 'community leaders' to outsiders (such as COs) – in fact wielded less influence within the community than a second type of the leader, the traditional tribal leader or 'patel'. The patel's influence and leadership – which in the village in question was expressed in idioms and

conventions not immediately recognised by outsiders as 'leadership' – was significantly underestimated. These different types of leaders appeared, moreover, to have different interests in relation to the project. The sarpanch and others with 'outside connections' may have seen potential for furthering their positions in extending support to COs. The patel, however, appears to have seen the project as a threat rather than an asset. In the event, by persistently refusing co-operation and effectively blocking participation of the whole community, he demonstrated his control over community opinion and action.

Launching an organised PRA exercise involving arrangements for the stay of a group of outsiders in a village (lighting, food preparation, etc) represents a visible commitment on the part of the project to a particular community. Where this is not based upon the gradual build-up of commitment on both sides (village and project), the PRA may in effect present the village with an artificial choice – 'do they or do they not want this initiative', before they are aware of the implications of this choice. Opting for caution and risk-aversion, village leaders may – as was the case in Khatama village – initially reject the approach. In such situations organised PRAs should occur only after a longer period of working informally with individuals or neighbourhood groups. In other cases concrete actions demonstrating the project's commitment to the village are necessary before the more formal PRA information gathering can begin. Sometimes it is helpful to take villagers to visit participatory development initiatives elsewhere or to arrange visits by groups with more experience of the project from other nearby villages. On the other hand, organised public PRAs sometimes do provide the most effective way of winning support for project activities.

Finally, the experience of the project has shown that effective communication with villagers is not only determined by factors within a village community (e.g. local anxieties about land or leadership patterns), but also by the wider networks of which individual communities are a part. Local perceptions of the activities of the project in Madhya Pradesh and Rajasthan have been influenced by current preoccupations concerning, for example, the activities of missionaries, anti-Narmada project activists and local mass organisation activists. Given that the bureaucracy and political system in the area is highly sensitive to work in tribal areas, careful development of the project's identity and credibility with a range of local institutions has been an important part of developing a participatory strategy for the project.

In sum, as an organised public event, experience suggests that PRAs should only be undertaken in a community after a

SOCIAL ACTION

(English Quarterly)

Published continuously since 1951, SOCIAL ACTION is a quarterly journal of social trends. Its objective is to facilitate relevant discussions among action-oriented intellectuals and intellectually inclined activists, as the basis for a constructive contribution to the social issues and developments of our times.

reasonably good knowledge of the locality and appropriate contacts have been developed. It is also necessary to have some means of assessing the adequacy of this knowledge for particular villages, and to identify appropriate indicators of 'good rapport'. This preparation usually requires considerable time, more than was in fact allowed for in the early planning of the project.

HOW PARTICIPATORY IS PRA?

The objectives of undertaking PRA are likely to vary with the stage of a project. In the early stages of KRIBP there was a clear trade-off between the objectives of 'rapport building' and 'information gathering'. Maximising opportunities for participation was not always compatible with getting the best or most accurate data. Local teams varied in emphasis, but it was widely accepted that early PRAs should give priority to the quality of project-community relations over the quantity of information output (not least because of the likelihood of bias in this information, see below).

However, despite efforts to broaden contacts, PRAs are unlikely to be equally accessible or open to all sections of the community. Initial PRA activities of the project have rarely involved a full cross section of the village community. Gender, age, education and kinship all influence participation in PRAs. In Chatra Khuta village (Rajasthan), for example, one of the two major descent groups in the community initially took a leading role, and the other, although not excluded, was less centrally involved. This highlights the risk that without further work the priorities and action plans identified for the village will reflect a narrow set of interests. Not only are some sections of a village under-represented, but also some participation is discontinuous over the course of the PRA. Above all, participation by women has in all PRAs been both limited and discontinuous (see below). The reasons for non-participation are likely to be as varied as those for participation, encompassing both practical (e.g. time, distance) and social (e.g. social factions and alliances) factors. In some cases strong leaders were able to 'mobilise' wide group participation, in others individual factors of interest and curiosity appeared foremost. Without some means of recording and monitoring participation in PRAs, non-participation and the information distortions it causes is often unrecognised.

Physical presence or absence is, of course, only a crude measure of 'participation', and there are many other ways in which involvement in PRA activities is uneven and discriminates against the recording of certain perspectives and gives priority to others. A record of individual involvement would clearly demonstrate the uneven nature of participation in PRA exercises, but even such micro-observations might not reveal important ways in which social relations

influence information generation in a community.

It is a truism to state that dominant views will tend to dominate. However, the way and extent to which recorded information will be biased in favour of perspectives which are not as general as they are projected as being is rarely considered or assessed. Indeed, I want to suggest that PRA, far from providing a neutral vehicle for local knowledge, actually creates a context in which the selective presentation of opinion is likely to be exaggerated, and where minority or deviant views are likely to be suppressed. In practical terms 'community priorities' such as school, soil and water conservation, social forestry or well deepening conceal private interests.

While from the point of view of 'outsider' development workers an organised PRA is an informal event, in social terms the PRA is often highly formal and public: PRAs are group or collective activities; they involve important and influential outsiders (even foreigners); they take place in public spaces (schools, temples, etc); they involve the community representing itself to outsiders; and information is discussed publicly, recorded and preserved for use in planning. Such activities are far from informal everyday life. It seems highly probable that this social formality imposes a selectivity on the kind of information which is presented and recorded in PRAs. At the very least, where critical debate in public is not an established convention, we should avoid unwarranted assumptions about the accountability of publicly processed information.

First, as public and collective events, PRAs tend to emphasise the general over the particular (individual, event, situation, etc), tend towards the normative ('what ought to be' rather than 'what is') and towards a unitary view of interests which underplays difference. In other words it is the community's 'official view' of itself which is projected. Communities are often most solidary when facing outsiders [Robertson 1984: 144]. People may express their equality and unity of opinion to outsiders through generalised expressions – 'we think, we want, etc'. These "rhetorical expressions of integrity of the community" are not to be mistaken for the absence of distinct and perhaps conflicting interests [Cohen 1989: 35]. The tendency to give normative information may be encouraged by faulty interviewing techniques [see Mitchell and Slim 1991], but often the very structure of the PRA sessions – group activities leading to plenary presentations – assumes and encourages the expression of consensus. Where sensitive subjects are being addressed, there is anyway an understandable tendency to move away from the individual and the particular to the general and abstract, or sometimes from the present to the past; i.e. matters of present sensitivity (e.g. bonded labour) are referred to as if they only

happened in the past (presenting problems in the interpretation of 'timelines'). As project staff we perceive a need for consensus information for the purposes of developing village workplans, and have yet to develop the means to handle differing or even conflicting views of local reality. There is sometimes, therefore, tacit compliance between insiders and outsiders in the generation of consensus views. More generally, the interactive context of PRA emphasises mediation between 'outsiders' and 'insiders', 'experts' and 'locals', but is not so good at identifying and handling differences of perception within communities. Indeed, at times writing on PRA appears to reinforce weak and sociologically naive concepts of the community.

Second, the perspectives and interests of the most powerful sections in a community are likely to dominate, not through overt competition or confrontation, but through this expression of consensus. I am referring to what Pierre Bourdieu calls 'officialising strategies' whereby the particular interests of key sections of the community become identified with the general interest [Bourdieu 1977: 38-43]. The ability to represent the personal and particular in universal terms to "...transmute 'egoistic', private, particular interests into...disinterested, collective, publicly avowable, legitimate interests" (1977:40) is a sign of authority and dominance. These "officialising strategies" involve possession of the "capital of authority necessary to impose a definition of a situation, especially in the moments of crisis when the collective judgment falters..." (1977: 40). It is perhaps not too far-fetched to consider the organised PRA carried out at the outset of a project's contact with a community as such a moment of 'crisis'. The community is called upon to judge the outsiders' intentions, take the risk of co-operation, provide collective knowledge, and articulate collective needs and priorities, in the knowledge that whatever is said will in one way or another have implications for the future of the community. These are, perhaps, critical moments at which far more than usual is at stake in controlling the flow of information: moments, moreover, when those in authority "...are able to mobilise the group by solemnising, officialising and thus universalising a private incident" (1977:40). One might go even further and suggest that the PRA actually presents a new means by which people in authority can 'officialise' private interests, by endorsing and putting on record dominant views.

Where a new project is perceived as likely to mobilise considerable resources for village development, the ability to identify personal interests with general ones and to ensure that these fall within the compass of project objectives offers potentially great material and political rewards. Sometimes the claim of universal validity for individual interests

is quite blatant and detectable – the PRA in which the sarpanch's desire for a contract for the school building was projected as a community need for education, is a case in point. But there must be many instances of this process which go unnoticed. The school was not really a project priority, so the sarpanch missed the mark; but today many community leaders are well aware of the benefits to be gained not only from projecting private interests as public ones, but in doing so in such a way that the priorities of projects and their funders are met or 'triggered'. In this sense 'environment', 'gender' and 'poverty' (i.e. global development priorities) are very much part of 'public' knowledge building in community development projects. However, clearly not all community needs will reflect disguised private ambitions. Indeed in the early stages of a project it would be impossible to judge the extent of such domination. Nonetheless, it is important to be aware of the possibility, and particularly to recognise that a PRA is a social event, and like any external intervention in a community, will be shaped and influenced by social processes which may only be detectable in retrospect. Finally, 'the project' is not simply an observer of this process. The presence of development workers itself alters the balance of power. They may be called upon to arbitrate between competing claims to knowledge, and may sometimes enable the expression of subordinate definitions of a situation.

Third, the methodological problems identified here are common to all attempts in social science to represent and model communities. The reason why I suggest these problems may be amplified in group PRAs is because of (1) the short time-frame of research, (2) the public nature of the enquiry, and (3) the possibility of information being used directly to generate material benefits for the community. These observations suggest the need for certain modifications to PRA practice. These would include the use of more decentralised or neighbourhood-based activities, avoiding or deferring public decision-making or problem prioritisation (e.g. at village meetings) and resisting the tendency to develop agreed or consensual views on complex problems until project workers are far more familiar with different parts of the community. The practice of organising separate interest-specific, gender or social group-based PRAs is now quite widespread, and given adequate attention, PRAs can be a useful tool in understanding and expressing difference. The identification of different or conflicting views, however, also requires development of the means to resolve these conflicts as a project develops a consensus for local action. This, I suggest below, is another weakness in current PRA practice.

The corollary of the dominance of 'official' knowledge about the community (or the

'officialising' of the views of dominants) is the exclusion of sub-dominant perceptions, and the relative absence of expressions of interests and opinions of these sub-dominant groups, who lack the ability to make general and public their private and particular interests. The clearest example of this is provided by the case of women in relation to PRA in the project.

WOMEN AND FORMAL PRAs

By far the most important observation from the first carried out as part of the KRIBP project was the minimal participation of women. Very few women attended these PRAs, their involvement was discontinuous, and they did not have a role in the round-up and planning sessions with which the PRAs often concluded.³ This raises both specific questions about women's participation in the PRAs in the project, and more general issues concerning assumptions about women's 'accessibility' and the representation of women's perceptions. This latter is not a new problem, nor one restricted to PRA research methods. At the end of the 1960s Edwin Ardener commented on the absence of women's perspectives in social anthropologists' ethnographies, which were often a product of only talking to men, and about women [Ardener, E 1975a:2]. What is significant is that the omissions were not (except in retrospect) striking. While men were universally accepted as 'good informants', able to articulate knowledge and explanations (models) which met the expectations of investigators, and which included representation of women's concerns, women were considered difficult to reach – "they giggle when young, snort when old, reject the question, laugh at the topic, and the like" (1975a: 2). It was possible to conclude that outsiders (ethnographers)... "have a bias towards the kinds of models that men are ready to provide (or to concur in) rather than towards any that women might provide" (1975a:2). Yet what is increasingly recognised is that dominant male models are incomplete; they do not and perhaps cannot express important aspects of women's experience and interests. This is not simply a question of researcher bias, but is also an issue of structural gender relations.

PRA methods have played their part in addressing some of these gender issues in field research. In many respects PRAs have provided good contexts in which to explore the ways in which men and women's experience, needs and perspectives differ, and innovative ways of representing these differences have been employed [e.g. Welbourn 1991, 1992, Sheelu and Devaraj 1992]. Nonetheless, the central problem of the dominance of male views still pervades the exercise of rapid appraisal for rural development. Of course, in some situations – such as the one discussed here – these

methodological problems are more acute than in others. Indeed the difficulty of involving women in PRAs reported here has a specific context. Group PRAs were used at the outset of a project working in an area unexposed to participatory development initiatives. Moreover, the project did not have its full complement of trained women field-workers. It is often exactly at this early and formative stage of a development intervention that priorities are formulated and the shape of the project is set. However effectively women may be able to participate in later stages of a project, this will not compensate for their early exclusion. The particular problems presented in the use of PRA at the very point at which a project is negotiating its contact with communities (when, for example, it is more difficult to set up separate women-only group discussions) are therefore worth analysing.

For several reasons, organised group PRA exercises in the project have not provided appropriate contexts for the articulation of women's perspectives for natural resource planning. First, women faced a number of practical constraints to participation. The PRAs took place during a season when women's work (especially weeding) does not allow participation (a choice based on the need to have PRAs during a season when few families migrate). PRAs assumed that women would be available collectively at central locations (away from the work sites of the home and field) for continuous periods of time. These requirements of time, location and collective presence were incompatible with the structure of women's work roles [Mehta 1992]. Women are rarely free of work responsibilities for substantial lengths of time, and it is hard to find times when women would be available collectively. This imposes major constraints on women's participation. Organised PRAs, for example, require the allocation of blocks of time away from field and house to carry out transects, mapping exercises, analysis and presentation which women are unable to give.

Second, women faced social constraints. PRAs usually took place in public spaces (e.g. schools) and in the presence of outsiders. Bhil women are typically (explicitly or implicitly) excluded from such public spaces and activities. This exclusion of women "is so normal and 'naturalised' that it is rarely noticed or questioned. In fact, the presence of women causes remark while their absence goes unnoticed" [Mehta 1992]. The comments made on the cultural specificity of 'informality' above have an important gender dimension. Notwithstanding the team's efforts to create relaxed and informal contexts, as mentioned earlier, the whole PRA exercise operated at a socially formal level. In a society which ascribes to women a sphere characterised as private, domestic, manual, low status, informal and by implication socially less visible and

valued, any event which creates processes which are perceived and understood as public and formal tends to exclude women [Mehta 1992].

Caution is needed, of course, in treating 'women' as a single group. Women's access to the 'public' of the PRA would vary with age, marital status, religion and class. There are also significant cultural differences within the area covered by the project. We are as yet inadequately informed to generalise about this. There are also specific forms of adaptation to exclusion. The public space available to Bhil women is often 'extended', for example, by secluding women by some form of purdah [cf Shaheed 1990, cited in Ram 1992]. Again, the extent of 'veiling' in public varies between different categories of women.

Third, not only the context, but also some PRA techniques themselves may have generated social exclusions. The representation of knowledge and experience in maps, tables, charts, etc, involved a formality which appeared to mark it out as the province of men. Women were typically excluded from the mapping of natural resources. Moreover, as Alice Welbourn points out from a different social context, many aspects of social relationships central to women's concerns cannot be represented spatially. When asked to draw improvements they would like, a group of Sierra Leone women replied, "the changes we need cannot be drawn". They were referring to social issues such as overwork, the breakdown of co-wife relationships, and violence from husbands [Welbourn 1991].

Finally, on several occasions during the early project PRAs when a few women were involved in PRA exercises, there was a difference in the way they responded to the tasks. Group discussions with women (and women field-workers) in one village, for example, tended not clearly to demarcate public from personal information, or the subject from the relationship. Women, for example, were concerned to know about the background of the interviewer; they asked personal questions and related stories. Women felt bored by certain exercises, the tasks remained incomplete and women gave up and began communicating by singing instead (observed by Mona Mehta).

We are inadequately informed about many aspects of gender relations in the project area, and it is too early in the life of the project to make generalisations about women and PRA beyond the specifics of these introductory PRAs. Nonetheless, I suspect that at least some of the observations made above (e.g. on practical and social constraints to women's involvement) will find parallels in other PRA contexts. It may therefore be useful, in a preliminary way, to highlight some wider themes which the particular experience points to.

Women (and to a different degree other subordinate social groups) appear restricted

in their ability to articulate their concerns in public and in acceptable mediums. Whereas dominant groups are able to generalise the particular and make the private public, women's own knowledge/power is often only articulated through men, their influence is exerted only as long as the appearance of male control remains [Bourdieu 1977: 41]. Public knowledge is by social definition generated by men and not by women. A 'systematic hierarchisation' condemns women's interventions and knowledge to the unofficial, private, domestic (1977: 41) – an order equally internalised and expressed by women themselves. Even where women's practical roles take them into the public, this is understood as private/domestic. As Kalpana Ram points out referring to women fishworkers in south India, who are engaged in wide fish marketing networks.

The expansion of women's space which occurs in the course of practice is understood and legitimised in Mukkuvar culture only through its imperfect reference to women's cultural responsibilities as wives, mothers and daughters [Ram 1992: 206].

In the same way, *public* expressions of women's interests (e.g. in the first PRAs) almost always revolve around health care, child care, nutrition, domestic work and acceptable home-based income generating activities [Mehta 1992]. They articulate a socially acceptable profile of women's activities. The early experience of PRA in the project suggests that there are major obstacles to women's articulation of interests in farming, natural resource management, or any other area of concern which falls beyond the publicly endorsed definition of women's roles.

Ultimately, however, what the reported 'inaccessibility' and 'inarticulateness' of women (in PRA) points to is not a practical problem, or even a problem of technique, but a manifestation of structural gender relations. These relations, which undoubtedly influence many information generating exercises, appear amplified in the context of the rather special 'public' created by introductory and rapport building PRAs, where, as I suggested earlier, much is at stake in the articulation of needs and priorities to outsiders with resources. As a more general problem, 'inarticulateness' as an aspect of gender relations has been theorised by many, but particularly aptly in Edwin Ardener's theory of 'muted' groups [Ardener, E 1975a, 1975b]. Ardener proposed that in any society there are dominant modes of expression generated by a dominant structure. It is these articulations that are heard and listened to, for instance by outsiders. Subordinate groups, if they wish to communicate, must express themselves through the same dominant modes. However, there is a lack of fit between the ideas and experience of subordinate groups and the modes of public communication available which produces a

characteristic inarticulateness or 'mutedness' among subordinate groups. This is not of course to say that women do not speak. "They may speak a great deal. The important issue is whether they are able to say all that they would wish to say, where and when they wish to say it. Must they, for example, re-encode their thoughts to make them understood in the public domain?" [Ardener, S 1978: 21]. A number of socio-cultural examples of 'mutedness' among women are given in the literature [Ardener, S 1975, 1978; Okely 1975; Callan 1975]. In some of these cases women are constrained in the expression of their interests by patriarchal definitions of their concerns. Arguably, this is what is happening in the context of a public PRAs in the project.

Perhaps Ardener's theory can be accused of being rather static and of ignoring the interplay of power. After all in many projects which have an explicit 'empowerment' goal, some of the clearest signs of progress concern the increased control that women gain over communicating their perspectives. In the introductory context of preliminary project PRAs, the influence of power on the articulation of knowledge is particularly prominent. In providing a way of thinking about the means by which these power relations influence women's communication, the theory of 'mutedness' does not, however, deny the importance of women's agency or the centrality of this in generating change.

To recap, what I am suggesting is, first, that an organised PRA sets up a particular context which gives privilege to certain types of knowledge and representation and suppresses others, and that there is an important gender dimension to this. PRAs will tend to emphasise formal knowledge and activities and reinforce the invisibility of women's roles. Moreover, women's agreement with projections of community or household interests will be tacitly assumed, and the notion of distinctive perspectives will be overlooked. Women do not have the power (and at the beginning of this social development project have not yet been able to develop the skills or competence) necessary to represent personal concerns publicly, and by default have to conform to the categories of legitimate concern given in advance. Put another way, women have to clothe their ideas and encode their desires in particular ways to make them heard and accepted as legitimate in the public domain of the PRA. But often their particular concerns do not find a place in the consensus which a PRA generates. Where women are concerned, much remains unsaid. This silence too may only confirm the dominant view that women have nothing to say in relation to natural resource management, and the invisibility of their roles in this area is reinforced and communicated to outsiders.

Second, and more speculatively, some aspects of women's experience and

knowledge may be encoded in ways which anyway are not amenable to the kinds of formal representation involved in PRA. The boredom and digression of women during PRA exercises is perhaps an expression of their 'mutedness' in relation to existing media of representation. I return to this issue below.

These observations highlight the need for a significant modification of PRA methodology in terms of social context, timing and techniques. There is a need to modify the organisation of PRAs to increase the opportunities for women's participation. There is a need to create non-public contexts in which women staff spend time with women, make more use of house- or field-based sessions (i.e. align PRAs with specific activities/spaces which mark 'informality'). Such PRAs are likely to involve shorter periods of time and activities which are compatible with continuing work, or to take place in small neighbourhood groups. Alternative and more informal ways of communicating knowledge, such as through practical demonstration or the use of stories, are needed. Also, a wider range of sources of information of women's perspectives could be tapped, including the recording of songs, proverbs, sayings, etc. Finally, there is need for constant attention to difference in the interpretation of information generalised for the community and household.⁴

The quality of information from women is likely to increase as women become more familiar with PRA techniques and more confident about articulating their perspectives (as is demonstrated by work with women elsewhere in India [Sheela and Devaraj 1992]). There is an important training role for project workers here in demonstrating the possibilities of giving formal representation – and by implication visibility and status – to women's knowledge. Indeed, if the formality and public nature of PRAs initially presents obstacles to the articulation of women's perceptions, this problem in the methodology of PRA, once recognised, is perhaps also a key to identifying the positive role of PRA in a strategy for increasing women's profile and involvement in rural development projects. Project activities take place in a socially formal domain, and unless women's perspectives are able to be articulated in 'formal' terms, women will remain apart from the planning process. PRA provides one means by which women's knowledge and activities (socially invisible but practically central) can be given formal recognition, support and status, or can be transferred from the informal to the formal arena of community and project planning.

INFLUENCE OF THE OUTSIDER

So far, I have only given oblique reference to the outsider in the generation of information produced by PRA. Of course, degrees of suspicion or trust frame a PRA exercise, and in some measure it is the

presence of the outsider which makes the PRA formal and public. The outsiders' concern with developing an overall picture is part of the in-built bias towards consensus. Moreover, 'local knowledge' is shaped by perceptions of project workers and their ambitions. There may be a 'conspiracy of courtesy' which conceals aspects of social life, or needs may be expressed in terms of the things which the project is perceived as being able to deliver. It is significant, for example, that while KRIBP initially generated a wealth of information on crops, soils, erosion, agro-inputs, and so forth, the PRAs failed to generate information on issues such as encroachment, and relations with the forest department or police, known to be key issues in the area, but perceived as beyond the remit of the project. Answers to direct questions about problems are likely to be strongly influenced by expectations people have of the project and its particular interest in them.

Not all potential biases in PRA are attributable to the community and the way it projects itself; many also come from the investigating team itself. The practice of PRA tends, for example, to be technique-led. Investigators go with a fixed set of techniques to try out. Techniques should serve an agreed research need, but they often become themselves the research framework. In part this is because the models of PRA practice which are established in training contexts emphasise the new and unfamiliar techniques. There are a number of important consequences. Unremarkable methods, such as informal interviewing, which do not produce visible outputs, are underemphasised in favour of techniques which generate attractive physical outputs such as maps and charts (coined by project team members as the 'aesthetic bias'). Implicitly, the production of observable outputs generates more status for the field-worker in report back sessions than would unorganised notes from informal interviews. This bias tends to under-recognise the work of women field-workers who (working with women) typically find it more difficult to produce neat charts and maps, or formal information more generally [Welbourn 1992]. Individual interests or enthusiasm for particular topics or techniques may also distort information gathering. The field-worker spending hours trying to complete a tree matrix ranking, only to finally give up in recognition that there was neither the interest nor knowledge among the group with whom he was discussing, is a case in point. But more generally, as a set of techniques PRA can falsely circumscribe learning. Carried out as a discrete activity, PRA can give the wrong impression that relevant planning information comes in the form of a set of completed PRA exercises. This can limit the acquisition of competence in more general participant observation, narrative reporting and analysis.

Last, it is not only in the generation of information that project staff exert their influence. There are also dangers of misrepresentation in the summarising, analysis and reporting of information by the team. An example will illustrate the problem. Villagers in one project village expressed a problem as 'house collapse'. This referred to the tendency of mud walls to collapse nowadays given the shortage of wood which traditionally is used in their construction. This problem was initially summarised by the team as 'kacca housing', falsely implying a desire for 'pacca' housing among the tribals. It was also very easy to exclude women's expressed needs (e.g. a hospital, flour mill, village shop) in 'summing up' because they did not fit neatly into the established categories of natural resource development.

In a sense of PRA, outsiders determine the 'ground rules'. Consciously or unconsciously project workers impose ideas of 'relevance' and determine what is accepted as knowledge.⁵ But do we adequately differentiate the different ways of knowing or articulating knowledge which may exist?

DIFFERENT TYPES OF KNOWLEDGE

I have already indicated how the articulation of knowledge is mediated by power relations both within the community, and between it and outside 'developers'. But, information and knowledge produced in any community is not all of the same type. Knowledge, for example, is more or less public, 'official', codified, agreed, recognised as such, and accessible to outsiders. In much of the PRA literature, however, there is a general assumption that knowledge is undifferentiated, and that given the right tools, people's knowledge is both recognisable and accessible. As Johan Potter puts it, the implicit message in much PRA literature is 'just ask, they know, and they are your friends' [Pottier 1991]. In reality, of course, knowledge is not so self-evident. The information manipulated through PRAs is often of very different kinds, involving mixed combinations of fact and value, consensus and difference, openness and sensitivity, the public and the private. Even where we are sure of the questions we may not adequately be able to interpret the answers. As Fairhead points out, explanations offered by people may be expressed in polite/evasive shorthand idioms, in idioms signalling distrust, as ethnic norms ('our way') or as uncertain exploratory hypotheses [Fairhead 1991]. It requires detailed knowledge of local socio-political contexts to distinguish between these different types of information, to make correct interpretations and so to treat information appropriately. Much the same applies to visual information. Exercises of participatory diagramming or mapping have a natural appeal to outsiders with limited local language competence as a way of getting at otherwise inaccessible

local understandings; but they do so by assuming, as Pottier puts it, that "environments exist essentially as physical worlds, that is spaces, 'uncontaminated' by cultural and social meanings" (1991:9). Reality is not so simple. On a transect diagram, for example, a tree appears simply as a tree, whereas in real life the tree (or its removal) may be a symbolic statement about gender relations, a statement about land tenure, or a sign of resistance to agricultural intervention by the state (1991:9). Moreover, which of these culturally constructed 'hidden' meanings is relevant, will depend upon to whom you talk.

We need, moreover, to be cautious in assuming that all relevant information is equally amenable to representation in PRAs. The power, authority and gender dimensions of this issue have already been discussed, but there are further general points. In any community, different areas of social and economic life are codified, or rule bound to different degrees. As Pierre Bourdieu, referring to the Kabylia (Algeria), points out, different domains of practice

are differentiated... according to the degree of codification of the principles governing them. Between the areas that are apparently 'freest'... (such as the distribution of activities and objects within the internal space of the house) and the areas most richly regulated by customary norms and upheld by social sanctions (such as the great agrarian rites), there lies a whole field of practices subjected to traditional precepts, customary recommendations, ritual prescriptions, functioning as a regulatory device which orients practice without producing it [Bourdieu 1977: 20-21].

It may not be unreasonable to suppose that the knowledge (informing practice) which is most accessible to outsiders is that which already exists in a codified form, i.e. explicit 'indigenous theories', explanations, rules, and agreed understandings. This is also likely to be an area where knowledge (or at least its public expression) is associated with authority. Other practices are not so easily explained, and are not so fully rationalised in theory. They involve what Bourdieu refers to as a 'semi-learned grammar' – i.e. sayings, proverbs, gnomic poems or spontaneous theories [Bourdieu 1977:20]. Then there are practices which involve an expertise which is not codified, but exists as unconscious schemes which produce practical fluency in a task, or skill in making a judgment.

For long, models of human cognition assumed that all knowledge was mediated by language and that language was essential for cognitive thought. However, Maurice Bloch reviews a body of psychological studies which show that much knowledge is fundamentally non-linguistic and non language-like [Bloch 1991]. Certain kinds of concepts involve networks of meanings which are formed independent of language through the experience of, and practice in,

the external world (1991:186). Classificatory concepts, for example, may involve "loose and implicit practical-cum-theoretical pattern networks of knowledge, based on experience of physical instances sometimes called 'best exemplars' (1991: 185). In terms of practical actions these may be linked to "scripts" and "schemata" which "are, in effect, chunked networks of loose procedures and understandings which enable us to deal with standard and recurring situations, for example 'getting breakfast ready', that are clearly culturally created" (1991:185). Indeed, Bloch suggests that the performance of certain complex practical tasks, or the making of complex judgments, requires that the knowledge underlying practices is non-linguistic (1991: 187). This is because the quantity of information and the speed with which it is to be processed requires that it is stored in instantly recognisable and usable 'chunks' rather than in language-like sentence strings. He cites the examples of motorway driving and the Malagasy farmer making a judgment about whether or not a particular bit of forest would make good swidden. The expertise involved in both situations, but particularly the latter, involves the processing of a phenomenal amount of information (e.g., on soil, vegetation, topography, aspect, etc) in an instant. Becoming an expert, Bloch suggests, involves the development of a dedicated mental apparatus for the packaging, storing and processing of specific chunks of information for handling familiar situations. Such learning is through long practice.

Much agricultural and other practical knowledge addressed through PRA, and which involves the simultaneous assessment of complex factors such as soil, hydrology, topography, and crop interrelations, may be of the same kind. The difficulty is that such knowledge may not be codified in a way which allows it to be directly represented apart from practice, at least not through language. While the use of visual imagery and mapping may offer advantages here over conventional interview methods, there may well remain large areas of relevant local expertise which are, quite literally, missing from the picture. The problem is not that as outsiders we have no access to practical knowledge – clearly under certain circumstances non-linguistic knowledge is 'put into words' – but that we have immediate access to only a part of it, or rather we have access to practical knowledge in a changed form. As Bloch puts it,

...when our informants honestly say 'this is why we do such things', or 'this is what this means', or 'this is how we do such things', instead of being pleased we should be suspicious and ask what kind of peculiar knowledge is this which can take such explicit, linguistic form (1991: 193-94)?

Not only should we treat 'explicit knowledge' cautiously in recognition of the fact that it

is likely to be different from that employed in everyday practical activities (1991: 194), but also because what is special about the knowledge may also be a question of whose knowledge it is. Once again there is a possibility that it is the knowledge or expertise of poorer workers or of women which is under-represented.

CONCLUSION

I have tried to show that some of the information arising from PRAs (e.g., statements of community needs and priorities) is likely to be problematic because it is produced in a social context where the influence of power and authority and gender inequality are likely to be great. In particular, it is the public nature of the PRA which makes the production of local knowledge subject to the effects of 'officialising strategies' and 'muting'. Second, I have suggested that information or knowledge generated in PRAs is, to a great extent, also shaped by the concerns of 'outsiders' and their interaction with 'insider' community members. Third, I have suggested that knowledge of certain kinds, which is embedded in practical expertise, may be encoded in ways which anyway make it inaccessible to PRA techniques.

These observations are not intended as bald statements of the limitations of PRA, but as a challenge for further innovation to generate methods which will better serve the needs of participatory planning. In relation to the problem of practical knowledge, for example, methods are needed which will prove able to distinguish different types of knowledge. Particularly, in addition to drawing on the sayings, proverbs, etc., mentioned above, there is a need to further develop non-linguistic and practical modes of learning. If certain types of knowledge are only learned by observation, and acquired by rehearsal, then outsiders themselves may also have to learn through sharing in the practice of a community. Certain kinds of expertise may only be transmitted when field-workers are able themselves to develop competence in key everyday procedures and reflect on them [Bloch 1991:194-95]. This reflection is important. In effect, it may mean 'unpacking' non-linguistic expertise and 'putting it into words'. Such an exercise is unlikely to add to the practical efficiency of a familiar operation. In fact quite the reverse. However, there may be distinct advantages to the change in character which practical knowledge undergoes when 'put into words'. For example, Bloch suggests that linguistic explicitness is associated with, and allows for, innovation (1991:193). Indeed, participatory approaches to development surely require the transformation of local knowledge so that it can be applied in new ways to problem solving and not simply its articulation.

Even supposing that existing bias in PRA information can be identified and more reliable information generated, a project such as KRIBP will still not have an adequate basis for participatory planning. If knowledge about livelihoods were equivalent to knowledge for action then undoubtedly villagers would have solved problems through self-help long ago. What is missing is an assessment of the limits of local knowledge and awareness, and the constraints to existing community systems of problem solving. Villager involvement in the collection and representation of information through PRAs is only the first stage in a strategy for participatory planning. Local skills often need to be developed in, for example, communicating information in a form which is understandable to outsiders with access to development resources, in analysing problems and identifying workable solutions, and in negotiating between different interests within the community [cf. Davis-Case 1989]. Translating individual, often fragmentary, experiences of a difficulty into the collective awareness of a problem with a view to change, and from this the formulation of a coherent programme of action (some involving collective action) often requires new skills, knowledge and confidence, and in some cases new institutional arrangements (usually implying some shift in the local distribution of power). In broad terms this means matching PRA with techniques of animation, awareness raising, non-formal education or community problem solving which have been a central part of participatory strategies of social action organisations for two decades. In other words, having identified and built upon existing knowledge, PRA should not ignore the need to broaden and deepen this knowledge, to build on and develop local systems of analysis and problem solving, and to develop confidence and organisational resources necessary for action. Having experienced the usefulness as well as the limitations of PRA techniques, the KRIBP project is now attempting to put into practice a strategy for participatory planning which builds in some of these elements. The project has thus recently tried to formulate a step-by-step guide for participatory planning which emphasises the need for preparation for PRA activities, the critical review of PRA outputs and the development of a wide range of tools for community-based problem analysis and planning.⁶

The techniques of PRA have contributed significantly to the promotion of participatory development. But while they offer new opportunities for the articulation of local knowledge including perspectives of women and other subordinate sections of communities, they may also expose projects to new risks by creating public contexts and a new idiom in which dominant interests can gain legitimacy. But perhaps, the greatest

danger is the promotion of PRA as a 'quick' methodology of participation, rather than as a set of techniques or tools which have to be used in the context of project-specific strategies for participatory planning. PRA has proved an acceptable methodology of 'participation' in large and bureaucratic organisations involved in rural development. Yet its advantages here over other tools of participatory development – its speed, the visibility of outputs, its amenability to use on a large scale – may also turn out to be its greatest weaknesses.

Notes

[The observations which inform this paper come from field-work and project team discussions in western India during August-October 1992. I am particularly indebted to Mona Mehta for her insights on the gender aspects of PRA and particularly the notion of the PRA as a 'formal' context. Due acknowledgement should also go to P S Sodhi - Project Manager, to T G Ekande, Supriya Akerkar, Utpal Moitra and Arun Joshi, core members of the project team. I would also like to acknowledge the contribution of the project's community organisers who skilfully and sensitively responded to the challenges presented in the early stages of the project, and of my colleague from CDS, Steve Jones. The paper arises out of consultancy work financed by the ODA, and the writing was made possible by an ESRC Fellowship, held under the Global Environmental Change Programme. Finally, I am grateful to Emma Crewe for a stimulating conference paper which prompted further thought on the nature of knowledge in development. Needless to say, while many of the above have contributed to the ideas of the paper, I am responsible for the particular analysis provided.]

- 1 ODA Project Framework.
- 2 Since July 1992, the KRIBP project has undertaken a systematic review of its PRA activities, and has modified techniques and approaches building upon the sorts of lessons which this paper highlights.
- 3 Having recognised this problem, the KRIBP project has taken steps to address the particular difficulties involved in PRAs with women. The project brought specialist skills into the project team and has attempted to develop a more comprehensive strategy for building women's perspectives into project planning [KRIBP Annual Report 1992 (Draft), Dahod].
- 4 The KRIBP project is trying to give practical shape to a number of these ideas.
- 5 Of course, in agricultural development the boundary between acceptable and unacceptable knowledge is constantly shifting. One significant shift 'created' the whole area known as 'indigenous technical knowledge'; but we have yet to see areas labelled as 'folklore', 'myth', 'ritual' or 'religion' admitted. These may however, be particularly important forms of knowledge precisely because they do not isolate 'technical' knowledge from its context in social relations.

Value Added Tax in a Federation

Commodity Tax Reforms in India

M N Murty

This paper discusses various types of VAT and their application in a federal country or a country with governments at many levels. In particular, it takes up a detailed examination of a comprehensive VAT covering the full chain of business activities from manufacturing to retailing. A case for having a comprehensive VAT at central and state levels in India is discussed. It finds that such a tax system supplemented by specific excises and subsidies to deal with the problems of equity, environment and social needs is ideal for India.

I

Types of Value Added Taxes

THE value added tax (VAT) is tax on value added by any economic activity (be it at the manufacturing, wholesale or retail level) to the commodities and services it buys from other economic activities. A comprehensive form of VAT covers value added at all three levels of business activities, viz. manufacturing, wholesaling and retailing, between production and final use of various goods and services. Currently, this form of VAT is predominant in the fiscal systems of many developed and developing countries.

There are three broad types of VAT depending on the extent of coverage of gross value added in the tax base. These are consumption VAT, net income VAT and gross income VAT.

The consumption VAT is the tax on the final sales to consumers by an integrated business firm carrying all the three levels of economic activities of manufacturing, wholesaling and retailing. As an illustration, take a firm which starts with the production of wheat, goes down the line to produce flour and bread and further down the line to engage in the wholesaling and retailing of bread. In carrying out the above process, the firm adds value to goods and services at each successive stage of business in comparison to the previous stage by using its own men and machines. The final price which is the price paid by the consumers for bread, covers all the value additions at successive stages. Therefore, it appears that the sum of value additions at various stages is equal to retail or final sales to consumers. This is of course true only in a closed and static economy. However, in the case of an open economy having imports, the retail sales of a commodity exceed the value added by domestic production to meet the part of domestic demand. It is so because the value added in producing imports accrued to the home country. In the case of export of a part of domestic production of commodity, the domestic value added exceeds the retail sales since the retail sales do not account for the value of exports. The treatment of exports

and imports under VAT will be discussed in detail in some of the following sections.

The income VAT considers income or net value added in the conventional sense as base. The aggregate base for this tax is consumption plus net investment. The gross product VAT takes gross value added in the conventional sense as base. The aggregate base for this tax is consumption plus gross investment.

There are in all three methods for computing tax liability under VAT. They are known as credit, subtraction and addition methods [Shoup 1990]. Under the credit method, a business firm keeps a record of VAT paid on purchases which are given in the purchase invoices along with the prices of goods and services purchased and takes credit for it while computing the net VAT liability on sales. For a given period, say a year, the firm collects all purchase invoices and finds the sum of all value added taxes shown on them which will be credited against its own gross tax to work out the net tax payable. The subtraction method prescribes the subtraction of total purchases from the sales to compute the base for VAT of a firm. According to this method, it is the value added by the firm in the conventional sense which acts as the base for VAT. The addition method prescribes the summing up of the factor payments to arrive at a base for VAT.

Table 1 describes the computation of the comprehensive VAT using the credit method. As mentioned earlier, a comprehensive VAT captures the total value added between the manufacturing and the retailing stages of supply of a commodity. Let us consider, as an illustration, the computation of VAT liability in the process of production and supply of bread in the economy. As described in Table 1, various business enterprises like a farm producing wheat, a mill producing flour, a bakery baking bread, wholesaling activity and retailing activity are involved. Start with a farm which purchases goods and services (which are assumed to be zero for the sake of convenience in this example) and incurs a cost worth of Rs 100 on its men and machines (value added) to produce wheat. The selling price of wheat is Rs 100.

Assuming a uniform 10 per cent rate of VAT, the tax liability of the farm is Rs 10. The gross and net tax liability of the farm is the same in this case because the purchases by the farm are zero. Next the purchase price of wheat by the mill is Rs 100 while the value added by the mill or the cost of men and machinery employed to produce flour is Rs 75. For the mill, the selling price of flour and gross tax liability are Rs 175 and Rs 17.5 respectively. The mill has a purchase invoice of wheat as Rs 100 with a VAT payment of Rs 10. Therefore, taking the credit for VAT paid on purchases, the mill pays the net tax equivalent to Rs 7.5. Now the bakery has the purchase invoice of flour for Rs 175 with the accumulated tax liability of Rs 17.5. Assume that it makes a value addition of Rs 25 while making bread and sells the bread for Rs 200. The gross tax liability of the bakery is Rs 20. After taking credit for the accumulated VAT on purchases, the net VAT liability of the bakery is Rs 2.5. Similarly, the wholesaler of bread generates incremental value added equivalent to Rs 20, thus making his selling price of bread and gross and net tax liabilities as Rs 220, 22 and 2 respectively. Finally, the retailers make a value addition of Rs 10 by selling bread, thus making the retail price of bread, gross and net tax liabilities as Rs 230, 23 and 1 respectively. It can be noticed in this example that the retail sales (Rs 230) are equivalent to sum of value added at various stages. Similarly the gross tax liability at the retail stage is equivalent to the sum of net taxes paid at various stages.

Table 2 describes the computation of tax liability using the subtraction method. At each stage of business, VAT is computed at a uniform rate of 10 per cent of value added at that stage. Again in this example, the retail sales are equal to the sum of value added at various stages. The sum of VAT collected at various stages Rs 23 is equal to the gross tax liability at retail stage $\text{Rs } 230 \times 0.10$.

The total tax collected under the tax credit method and the subtraction method is the same in the simple example described above. However, differences between these methods

with respect to tax revenue collected arise when there is either an exemption of an intermediary firm from VAT or when there are exports and imports in the economy. Suppose firm B, the flour mill, is exempted from VAT. Under the tax credit method, firm B need not file a tax return and therefore the chain of tax credit is broken. There is no record of tax (Rs 10) collected on the sales of the farmer (firm A) to firm B on the purchase invoice of the baker (firm C) so that C cannot take credit for that. Thus the bakery now pays a net tax equal to Rs 20 instead of Rs 2.5 which it was paying when firm B was not exempted from the VAT. Therefore, the cumulative VAT will be larger than the VAT at the same rate applied to aggregate value added or the value of retail sales by an amount equal to Rs 17.5 in the above example. In the case of subtraction method, the exempted firm, the flour mill, does not pay the tax on its value added. The cumulative VAT will be smaller than the tax collected at the same rate on aggregate value added by an amount equal to Rs 7.5.

With the credit method, the tax chain is not broken if zero rating is done for an intermediary firm instead of its exemption from paying VAT. With zero rating, the particular firm's gross tax is computed at zero rate and taxes paid by other firms in the earlier stages of tax chain are refunded. In the above example, if the flour mill is zero rated, the gross tax on its sales will be zero and it gets a refund of Rs 10 paid as VAT on farmer's sales to the mill. The total VAT will be the sum of (a) the gross tax on sales by bakery to the wholesaler (Rs 20) and (b) net taxes paid by wholesalers and retailers (Rs 3). Thus the cumulative tax collected in this case is same as the total tax collected at the same rate on the retail sales or total value added.

In an economy with international trade, a choice has to be made between destination and origin principles to determine the VAT liability of imports and exports. Under the destination principle, exports are not taxed in the home country and imports are taxed in the foreign country while under the origin principle the converse happens. The tax credit method with destination principle requires the zero rating of exports and refunding by the treasury of VAT paid in all the prior stages of production of exports to the exporter. This can be easily accomplished because the exporting firm submits a tax return and subtracts from its zero gross tax the sum of taxes shown on its purchase invoices. In contrast, the zero rating of exports is not possible under addition and subtraction methods. In the case of the origin principle, exports are taxable as domestic sales and as a result, the credit, subtraction and addition methods are all suitable for computing the VAT liability.

The tax credit method with destination principle requires taxing of full value of imports by the importing country, because no tax credit is allowed for a VAT collected by the exporting country. The subtraction and addition methods also do not have any problems for computing the tax liability of imports. Under the origin principle, only value added after importation has to be taxed.

II VAT in a Federation

In a federal country, there are governments at different levels with constitutionally assigned fiscal responsibilities. The fiscal responsibilities are normally shared by three levels of government, viz, central, state and local governments. Governments at all three levels, may levy taxes on commodities and services so that a tax reform leading to an introduction of VAT by the government at one level can have fiscal consequences for the governments at other levels also. Therefore, a tax reform requiring the introduction of a VAT in a federation should have the following objectives:

- (a) the tax reform should be revenue neutral between the governments. In other words, it should not cause gain in revenue to government at one level at the cost of governments at other levels.
- (b) the tax base should be uniform across the nation.
- (c) the lower level governments like the provincial and local authorities should have the autonomy to set the tax rates to reflect

their own social and economic priorities and fiscal needs.

(d) the central and provincial taxes should be such that the inter-jurisdictional border controls and adjustments are minimum.

(e) the tax should be neutral to location of economic activities.

(f) the tax should be relatively simple to administer and to achieve complete compliance.

(g) taxes on the international flows of goods should be based on uniform rules across the nation.

(h) inter-governmental tax co-ordination has to be secured such that un-economical or inefficient tax competition among different jurisdictions or states is minimised.

Poddar (1990) also considers some of the above stated objectives as ideal and provides the following four options for the introduction of a VAT in a federal country:

- (1) a national VAT with inter-governmental revenue sharing arrangements.
- (2) origin based VAT
- (3) destination based VAT
- (4) a joint federal and state VAT

The *national tax with revenue sharing arrangements* requires that a VAT to be imposed at uniform rate across the nation, and the revenue collected from the tax is shared by governments at different levels on the basis of a commonly agreed formula. The sharing of revenue from this tax depends upon the negotiations between central and state governments. The revenue allocation agreed upon by the states takes into account fiscal need and capacity of individual states, as well as their share in

(c) Sales	230	23	253
(d) Net VAT		1	

national output and consumption. This tax is easy to administer and also simple to comply with. It does not require any special arrangements for calculating tax liability from inter-state movement of goods. The main limitation of this approach is the lack of fiscal autonomy to states.

The *origin based VAT* requires that a given state imposes taxes on sales of business firms residing in the state irrespective of whether the sales are meant for those persons residing in the state or persons staying outside the state. A tax credit method is used to allow an input tax credit for any taxes paid on the purchases by the firms, including those collected by exporting states on interstate purchases.

Under *destination based taxes*, the tax revenue from the supply of a product or service is calculated at a rate applicable to the state where final consumption occurs. With the tax credit method, the tax burden on the consumers depends upon the tax rate applicable at final retail sales and it does not depend upon the varying rates of taxes imposed during intermediate stages of business. Therefore, with this method, interstate variation in tax rates will not affect location of production and interstate pattern of trade.

The *joint national-state VAT* has two components: a federal tax imposed at a uniform rate across the nation and a state tax with variable rates across the states. Each business firm is required to compute federal and state taxes on each sale. The state taxes are those of the states to which the goods are shipped by the firm. The firm has to report its output tax payable to the federal and state governments separately at the end of each VAT payment period. In a similar manner, it has to segregate its input taxes for each government. The firm's VAT liability for the period would be the sum of all output taxes minus the sum of all input taxes, which it remits to a central tax collecting authority. The output and input taxes reported by the firm would be credited and debited to the accounts of appropriate governments by the tax collecting agency.

III

Experience of VAT in Some Federal Countries

Countries like Brazil, Canada, Germany and Mexico are among some of the federations currently having VAT. Gillis et al (1990) and Burgess and Stern (1992) provide a review of VAT experiences of these countries.

Brazil introduced VAT in the year 1967, federal tax replacing wholesale tax and the state VAT replacing the state turnover tax. The tax base for the federal VAT is industrial production. Agriculture, minerals and

services are excluded from the tax. The tax base for state VAT includes all goods with the exception of some industrial products, imports, agricultural inputs, food products and services. State VAT is administered by a council of states.

Mexico has been having a VAT since 1980. In that year, VAT has replaced 30 federal excise taxes and 400 municipal and state taxes. The tax base covers business connected with sale of goods and services, the granting of temporary use of property and importing of goods and services. Zero rating is applied to agricultural products and machinery, medicines and exports. The exempted goods and services are housing construction and rentals, passenger transport, education, medical services and public administration. Mexico has uniform VAT rates and bases across the states and it follows the destination principle. The tax may be regarded as a unified national VAT with revenue sharing.

Germany introduced VAT in 1968. All taxable transactions taking place within the boundaries of Germany are subjected to VAT. The destination principle is used to tax inter-state and international flows of goods and services. The VAT-exempted goods and services are financial and insurance activities, real estate transactions and services of physicians and dentists. A reduced rate of VAT applies to certain foodstuffs, raw materials, books and cultural activities.

Canada has had a relatively little experience with VAT since it was introduced only recently. Originally, a national VAT with a single base for all the states with each state having an option of charging an additional rate was mooted as a part of tax reform. In 1991, only federal VAT was introduced which applies to all supplies of goods and services unless they are zero rated or exempt. Transportation services, financial services, certain medical categories and agricultural and fishing supplies are zero rated. The exempted goods and services are health, educational and legal aid services, financial services, real property and transportation tolls. In 1992, only Quebec state had opted for provincial VAT.

IV

Pre-Reform Structure of Commodity Taxation

India is a federation with governments at different levels: central, state and local authorities. The Indian Constitution has clearly demarcated the functions of central and state governments. The functions of governments are classified under three groups: centre list, state list and concurrent list. The centre list consists of defence, national industries and mines, foreign

affairs, banking and currency, inter-state commerce, national highways, railways, airways, telecommunications and waterways. The state list covers health, education, agriculture, irrigation, roads, and law and justice. Labour relations, education and criminal law fall under concurrent list. Accordingly, the Indian Constitution makes revenue and expenditure assignments to governments at different levels to carry on the constitutionally entrusted functions.

The revenue instruments of centre are excises, customs, income tax and taxes on capital gains. The sources of revenue for state governments are sales taxes, excise duty on alcohol, tax on profession and trades, taxes on land and buildings, entry tax on goods entering the state, taxes on vehicles, taxes on entertainment, agricultural income tax and stamp duty. Commodity taxes are the main sources of income for both centre and states. They constitute around 80 per cent of tax revenue for centre and 95 per cent of tax revenue for states. Customs and excise duties respectively constitute 47 and 34 per cent of tax revenue of the centre while sales taxes and state excises respectively constitute 58 and 15 per cent of state tax revenue. There is a mismatch between constitutionally assigned revenue collecting powers and expenditure responsibilities of different levels of government in India. While the centre is favourably entrusted with more revenue raising powers than required to meet its expenditure needs, states and local self governments are left with revenue raising powers much short

TABLE 2: SUBTRACTION METHOD - AN ILLUSTRATION

(d) Tax	1

of their expenditure needs. The above observed discrimination between centre and lower levels of government may be justifiable on certain grounds. It is convenient to levy certain types of taxes by the centre and redistribute the revenue proceeds to states rather than states collecting those taxes. There are some less developed states with little tax potential so that their expenditure needs cannot be met by local taxation even with all the instruments of taxes at their disposal. Therefore, the balanced regional development of the Indian economy requires that more developed states have to contribute to the development of less developed states which can be done only if centre has more powers to tax and redistribute in favour of backward states. The Indian Constitution has taken care of this problem by entrusting more revenue-raising powers to centre and creating an institution called Finance Commission to facilitate transfer of resources from centre to states.

Introduction of tax reforms in India has to take cognisance of its implications for centre-state financial relations. In the Indian federation, the fiscal system which does not co-ordinate the fiscal decisions of different levels of government contributes to many inefficiencies some of which are given as follows:

(a) There can be a conflict between the fiscal objectives of centre and state governments.

(b) There is an overlap between the tax bases of central excise duties and state sales taxes which can lead to cascading. Given the common tax base, changes in the central excise duties may affect the state's revenue and tax rates vice versa [Murty and Ray 1990]. In other words, unilateral decisions by central and state governments about commodity taxes may generate reciprocal externalities in terms of effects on the revenue of each government.

(c) Widespread taxation of inputs by both centre and states without giving credit to taxes levied by centre while fixing taxes by the states and vice versa leads to cascading and rising commodity prices.

(d) Autonomy of state governments to fix tax rates may provide incentives to their strategic behaviour. State governments may compete by reducing their relative tax rates so that each one of them can attract business and investment at the cost of the others. This type of strategic behaviour by states which is known as fiscal competition, may contribute to lower rates of provincial taxes and revenues and less than optimal provision of public services (Mintz and Tulkens 1986 and Murty 1992a and b).

(e) Both central and state taxes are marred by the complexity of rates and bases which has contributed to significant difficulties in administration and to tax evasion.

(f) Incomprehensive tax base for the taxation of domestic goods and services has led to reliance on trade taxes as an important source of revenue to central government.

Take for instance, the reforms of trade taxes suggested by Chellaiah Committee Report (1991, 1992). The suggested reform was to reduce the average rate of import tariff to 25 per cent level by the year 1998-99. If such a reform has to be revenue neutral, it has to be accompanied by revenue augmenting reforms in domestic taxation. In federal India, switching over from trade taxes to domestic taxes, though it is welcome, can create problems for sharing the tax revenue for governments at different levels. The centre and state financial relations are such that the revenue collected by the centre from domestic taxes on personal income and excise duties on goods and services has to be shared by centre and states while the revenue from trade taxes entirely accrues to the centre. According to the recommendations of Ninth Finance Commission, 45 per cent of revenue from excise duties and 85 per cent of revenue from personal income taxes have to be distributed among the states. For instance, a fall in revenue by Rs 100 from customs duties causes a loss of revenue of the same amount to centre while a compensatory increase in revenue by Rs 100 through either excise duties or income tax will bring less than Rs 100 gain to centre (Rs 55 in the case of excise duties and Rs 15 in the case of income taxes).

Consider as an illustration, the case of additional resource mobilisation in the central and railway budgets for the year 1992-93 in the context of tax reforms leading to major reductions in the rates of customs duties. The reductions in the rates of customs duties contribute a loss of Rs 20,230 million to the centre which is more than compensated by the increase in revenue from domestic taxes. The increase in revenue from excise duties, income tax

and corporate tax are respectively Rs 22,110, 5,700 and 325 million. However, after facilitating the sharing of central tax revenue by centre and states as per the recommendations of Ninth Finance Commission, centre incurs a loss of revenue amounting to Rs 5,270 million while the revenue gain to the states is Rs 15,000 million. The 1992-93 railway budget aimed at a revenue gain of Rs 13,660 million over the previous year and after taking into account this amount, the net additional resource mobilisation for centre amounted to Rs 8,490 million. This meagre amount of additional resource mobilisation by the centre may not be sufficient for its additional expenditure needs resulting in a deficit in the revenue account. The estimated revenue account deficit of centre for 1992-93 forms 2 per cent of GDP. The persistent revenue account deficits will make the centre a net borrower resulting in the rising fiscal deficits over time.

The Tax Reforms Committee (Interim Report 1991 and Final Report 1992) had recommended a full-fledged value added tax system at the central level covering almost all commodities and services with the exception of raw produce of agriculture. The Committee recommends the following commodity tax reforms to facilitate a smooth change to VAT at the centre:

(1) Make tax base comprehensive by giving limited exemptions and bringing more commodities under the tax net. Most of the commodities manufactured by decentralised and small-scale sector can also be brought under the tax net. Extend the taxation to service sector. Moderate taxes can be levied on advertising services, services of stock brokers, services of insurance of automobiles, residential property, personal effect and jewellery and residential telephone services.

(2) Replace specific taxes by *ad valorem* duties. With *ad valorem* duties, there can be an enhanced elasticity of revenue with

TABLE 3: ADDITIONAL RESOURCE MOBILISATION IN THE CENTRAL AND RAILWAY BUDGETS FOR 1992-93 (Rs million)

	Centre's Share	States Share	Total

(III) Total (I+II)	8490	15000	23490

Source: Economic Survey: 1992-93, Government of India.

respect to national income and buoyancy of revenue on account of increase in prices.

(3) Reduce the multiplicity of tax rates to two or three rates.

(4) Give credit to taxes on inter-regional trade such as central sales tax and consignment tax when provincial taxes such as sales taxes are levied by the importing state. Also, credit the revenue collected through taxes on inter-regional trade to a central pool such that this pool is shared by centre and states on the basis of an agreed formula.

In many important earlier studies on commodity tax reforms in India, due recognition is not given to the federal structure of taxation peculiar to India. In two important recent analytical studies, optimal commodity taxes are computed with the assumption that there exists only one centre of authority or unitary form of government [Ahmad and Stern 1984; Murty and Ray 1989]. Even in the commodity tax reforms suggested by the Jha Committee Report, 1978 and the Cellaiah Committee Report, 1992, reforms in central excise duties are suggested without considering in a detailed way the required accompanying reforms in sales taxes levied by states. The Jha Committee Report recommends a central VAT up to the manufacturing stage plus a retail sales tax in the states. The Cellaiah Committee recommends VAT up to the wholesale stage but believes in the states levying and retaining the revenue from that tax.

V

Comprehensive VAT: An Ideal Structure of Commodity Taxation

The ultimate aim of commodity tax reforms in India should be a comprehensive VAT covering value added by all business enterprises from the manufacturing to the retailing activities. The tax should have consumption base and follow the tax credit method to compute the net tax liability of a business firm. The tax liability of international and inter-state flows has to be calculated using the destination principle.

Table 1 describes the operation of a comprehensive VAT with the unitary form of government. However, considering that it can be ideal to have a central VAT and a state VAT in India, the following two alternative tax regimes can be considered: (a) a national VAT and parallel state VAT on the same base and (b) a national VAT up to the manufacturing stage and a state VAT at the wholesale and retailing stages.

In the case of a national VAT and a parallel state VAT on the same base, the state and central VAT rates can be different. Following the procedure described in Table 1, firms would have to calculate their net taxes payable to centre given the central tax rate and in a similar fashion they would

have to calculate the net taxes payable to the state given the state's tax rate. The tax liability of international flows would have to be computed using the destination principle. Even in the case of inter-state flows, destination principle has to be followed with zero rating of exports from the given state. Full value added by imports are taxed by the importing state at the rate applicable to it and the tax collected is credited to the exporting state. Alternatively, the exporting state could collect the tax from the exporter on the value added up to the exporting stage at the rate applicable to the importing state. Also, the importing state collects the tax from the importer and the retailer on their respective incremental value added at each stage and credits the tax collected to the exporting state. Since each state can both be an exporter and an importer, net tax liability to the other state can be computed after taking into account all the trade flows. Therefore, each state has to maintain a tax clearing department for inter-state trade. With this method, exporting state gets credit for taxes paid on the value added in the importing state also.

Alternatively, while considering the inter-state trade, a method can be adopted in which each state can tax value added in its territory. In this case, exporting state will collect the tax on value added up to exporting or manufacturing stage which forms part of its revenue. The tax can be collected either at the home rate or the rate applicable to the importing state. The tax on additional value added at the stages of importing and retailing is collected by the importing state at its own rate and kept it as its revenue. In this case, there is no need for tax clearance mechanism in each state. In case, the exporting state is allowed to collect the tax on the value added up to the manufacturing or exporting stage at the rate fixed by it (as is normally the case with the origin principle), there can arise a price discrimination between imports and the home-produced goods in the importing state. This may lead to inter-state fiscal competition with each state reducing its tax rate to increase the exports to the other state. Alternative, the exporting state can apply

zero rating for its exports and the importing state collects the tax on the total value added up to the retailing stage. However, the importing state keeps the tax on incremental value added during the importing and retailing stages and credits the rest of the tax to the exporting state.

One approach which may be more relevant for the Indian case is the sharing of tax base by the centre and states. In this method, value added up to the manufacturing stage can be the base for the central VAT while the value added up to the retail stage or total value added is the base for the state VAT. In this method, credit can be given to the central VAT when the state VAT is fixed at the wholesale or retail stage. In the case of the example described in Table 1, if centre and a particular state have 10 and 5 per cent VAT respectively, centre collects Rs 20 as tax on the value added of Rs 200 up to the manufacturing level. The wholesaler purchases goods worth of Rs 200 from the manufacturer and makes a value addition of Rs 20, thus making his total sales equal to Rs 220. He computes the gross tax at the rate of 15 per cent (central rate of tax of 10 per cent plus state's tax rate of 5 per cent) which becomes Rs 33. He gets credit for Rs 20 paid to the centre as central tax and therefore he pays net tax of Rs 13 to the state. The retailer makes purchases worth of Rs 220 and makes a value addition of Rs 10, thus making sales worth of Rs 230. His gross tax liability at the rate of 15 per cent of sales or total value added is Rs 34.5. Also, the retailer gets credit for the central tax of Rs 20 and the state tax of Rs 13 paid by the wholesaler. Therefore, his net tax liability to the state is Rs 1.5. Thus with this method, as described in the example given in Table 4, the centre collects Rs 20 as tax while the state collects tax worth of Rs 14.5 on the retail sales worth of Rs 230.

The advantage of this method is that only taxes at wholesale and retail stages are relevant for the inter-state trade flows since there are no state taxes up to the manufacturing stage. With the destination principle, there is no need for zero rating of exports by the exporting state. If the

TABLE 4: COMPUTATION OF STATE VAT USING BASE SHARING METHOD

				(Rs)
Activity	Goods and Services	VAT	Total Billings	
(1) Manufacturer sales	200	20	200	
(2) Wholesaler				
(a) Purchases	200			
(b) Value added	20			
(c) Sales	220	33		
(d) Net VAT		13		
(3) Retailer				
(a) Purchases	220			
(b) Value added	10			
(c) Sales	230	34.5		
(d) Net VAT		1.5		

wholesaler is an importer also, taxes collected by the importing state from the importer and the retailer have to be credited to the exporting state. Alternatively, if the importing state has the right to retain the taxes collected on incremental value added to imports in its own territory, it can deduct this amount of tax from the gross tax collected on imports and credit the balance to the exporting state. In the above example, out of gross state tax of Rs 14.5 collected on imports, it can retain Rs 1.5 (5 per cent of incremental value added by the importer and the retailers) and the balance of Rs 13 can be credited to the exporting state.

VI

Problems of Implementing a Comprehensive VAT

Implementation of a comprehensive VAT with one or two rates for centre and states in India, though desirable from the practical point of view, can have problems from a developing country's perspective. Many writers including Musgrave (1987) and Deaton (1987) have suggested uniform commodity taxation in the developing countries. Musgrave (1987) has suggested a general consumption tax assessed on a broad base and at a uniform rate. In his words:

In industrialised countries such a tax may be imposed as either a retail sales tax on consumption or a value added tax of the consumption type, that is, a value added tax that exempts capital goods from the base. Where both the options are available the choice between them is a matter of administrative convenience. The identical base is covered and the burden of distribution will be the same. In developing countries, however, the retail option is typically not available, because retail establishments tend to be small, informal and unstable. Thus sales cannot be determined readily, and enforcement at the retail level is difficult. The trend, therefore, has been towards a value added approach.

Such a tax cannot tackle the problem of equity, which is an important problem in the developing countries. Murty and Nayak (1994a and b) have shown that there are significant welfare losses associated with uniform commodity taxes in India. Musgrave has prescribed the following alternative subsidy/tax arrangements to supplement a broad-based uniform tax.

(a) a lower relief from a general consumption tax via income credit.

(b) to combine a higher rate of consumption tax with the exclusion of certain consumption items that draw a large share of low income budgets, and

(c) to supplement the broad-based consumption tax with a set of *ad valorem* excises

imposed on items that weigh heavily on high income groups.

Musgrave's prescription (a) may not be suitable to India where a large part of the population is not covered by income tax. In India the income tax base is not comprehensive and the major part of the population does not pay income tax. Therefore options (c) and (d) of Musgrave are more suitable for India.

The necessity for having environmental pollution taxes on pollution-intensive commodities and specific taxes on social bads like tobacco and alcohol is another limitation in having a uniform value added tax. Take for example, taxes on electricity. In the case of a uniform VAT system, a VAT levied on electricity say at 10 per cent does not distinguish between the hydro and thermal power. However, from the point of view of environmental protection, different rates of taxes have to be levied on thermal power and hydro power. If there has to be a pollution tax on coal, VAT should be higher on coal than on hydro power.

VII

Conclusion

A comprehensive VAT with consumption base covering the full chain of business activities from manufacturing to retailing is identical to a tax on retail sales. Given a choice between a VAT and a tax on retail sales, a developing country has to opt for VAT, because retail sales departments are small, unstable and informal in those countries.

A comprehensive VAT with the consumption base, the tax credit method, and the destination principle to determine VAT on international and inter-state trade flows can form an ideal commodity tax structure for India.

In a federal country like India, it may be ideal to have state and central VATs substituting the current state and central taxes on goods and services respectively. There can be two types of tax regimes with the state and central VATs: (a) the parallel state and central VATs on the same base covering business from manufacturing to retailing stage and (b) the central VAT up to the manufacturing stage and the state VAT at wholesaling and retailing stages. Tax regime (b) may be ideal for India.

A VAT with one or two rates has to be supplemented by the special excises and subsidies to deal with the problem of equity, environment and social bads like tobacco and alcohol.

[This paper forms part of work for a research project on 'Fiscal Instruments for Water Pollution Abatement in India' funded by IDRC, Canada. I am grateful to Sushama Murty for carefully going through an earlier draft of this paper and providing some suggestions for improvement.]

Vedic Mathematics

Jashbhai Patel

THIS is in support of S G Dani's appeal (EPW, July 31, 1993): "It is high time that the saner elements joined hands to educate people... lest the intellectual and educational life in the country get vitiated..." Around 1976, the book *Vedic Mathematics* by Jagadguru Swami Shri Bharti Krishna Tirthaji Maharaj was referred to me. I refused to comment on it at that date because I did not know then nor know now a single word of Sanskrit. Even then, I was surprised to read the contents. It consisted of the various tricks to do arithmetic simply. No doubt, to discover an original or a new method in arithmetic or for that matter in any other field is a sure sign of a genius and the jagadguru was perhaps one such genius. I do not want to dispute this fact. What I felt then was this: to call his work mathematics, as the word is understood in the modern world, was certainly and highly problematic. Further, that the work was contained in the Vedas was beyond verification for me because I had not read them. However, I was fairly familiar with the work: *History of Hindu Mathematics – A Source Book*, Parts I and II by Bibhutibhushan Datta and Avadhesh Narayan Singh (1935, 1938). This is the best and the most reliable scholarly work on Hindu mathematics. The first part is devoted to Hindu Arithmetic and the second part deals with Hindu Algebra and a few allied topics. I did not find in this great work any reference to what the jagadguru had written about in his book. This did cast some doubt in my mind but I was not Bibhutibhushan Datta, a remarkably great scholar of Sanskrit and mathematics, whose student Dhar (Krishnamurthy Foundation, Rajghat) said to me in Benaras that he became a sanyasi in his later life, to dispute the jagadguru's claims. I am happy that Dani has exposed the worth of the jagadguru's book in his article.

The most painful question that remains unanswered is: why a very learned man like the jagadguru stooped so low as to practice this deceit of forging a copy of a Veda and hoodwink his countrymen? The Shankracharyas do play their brand of dirty politics to promote their proteges ('chelas') to the temple-thrones ('gadis'), but where was the need to tamper with the Vedas and tinker with the history of Hindu mathematics?

Was he not aware of the fact that the most of Hindu mathematics is not Vedic? The following list of Hindu mathematicians proves the fact beyond doubt: (1) Aryabhata I (499 AD), (2) Varahamihir (505), (3) Bhaskara I (522), (4) Siddhasen Gani (550), (5) Lalla (598), (6) Brahmagupta (628), (7) Sridhara (750), (8) Mahavira (850), (9) Prathudakasvami (860), (10) Manjula (932), (11) Aryabhata II (950), (12) Bhattopala (966), (13) Sripati (1039), (14) Bhaskara II (1150), (15) Mallikarjuna (1175), (16) Amaraja (1250), (17) Simhatilaka (1275), (18) Narayana (1350), (19) Makhibhata (1377), (20) Gangadhara (1420), (21) Parmeshwar (1430), (22) Laxmidas (1500), (23) Nilkantha (1500), (24) Jnanaraja (1503), (25) Suryadas (1538), (26) Ganesa (1545), (27) Krsna (1580), (28) Ranganatha (1602), (29) Munisvara (1608), (30) Nrsimha (1621), (31) Ramkrishna (1648), (32) Kamalakara (1658) and (33) Pathumana Somayaji (1733). The jagadguru could have added his name to this list with lustre by writing the book under his own name instead of taking a totally wrong, devious, unethical, deceitful path.

This list is by no means exhaustive. Some mathematicians in the list were originators; others were commentators and writers of mathematical treatises. The dates in parentheses represent either the birth-date or the date of the manuscript. A great deal of work needs to be done in all the fields of Indology, and, if the present-day Hindus or Indians take to the art of forgery of the existing or unearthed manuscripts then the task of writing the correct history of this country would be next to impossible.

I will now touch upon a few aspects of Hindu mathematics. First, some very important milestones of Hindu mathematics:

(1) Hindus knew Pythagoras (569?-500? BC) theorem in 800 BC.

(2) Even if the credit for the invention of zero and the place value system is given to American Red Indians, even then the invention of 10 symbols 0 to 9 and the place value system associated with these 10 symbols are Hindu and are in Bharat. This way practically most of arithmetic was developed in India. And this type of arithmetic is in vogue in the world – whatever may be the refinements.

(3) Most of the elementary algebra or high school algebra in the world is of

Hindu origin. In fact, India's made remarkable contributions to the solution of linear, quadratic, indeterminate, equations associated with rational triangles and quadrilaterals, and with multiple equations.

(4) Even if the origin of trigonometry is ascribed to Greeks, the fact remains that the words 'sine' and 'cosine' are derived from the Sanskrit word 'jiva'. The Indian tables of sines and cosines were superior to those of Europe right up to the time of Sawai Jai Singh (died 1743) of Jaipur.

Most of this research is not Vedic. Do Hindus want to push them back to the Vedas? If not, what sense is there in teaching Vedic mathematics. We need to preserve these manuscripts honestly and truthfully in order to keep the history of mathematics intact. Also, Hindus should ask themselves one simple question: why they failed to build modern mathematics when they were in the lead. The answer is, they failed to recognise the imaginary roots of the quadratic equations. That is, they could not devise the symbol 'i' for the imaginary number equal to the square root of minus one. For this reason, they could not achieve much in the solution of cubic and biquadratic equations. The question of solvability of quintic in the manner of quadratic and its insolubility did not arise because these problems were far beyond their reach. The symbol 'i' revolutionised trigonometry also. In short, 'i' sets apart more or less the European mathematics from the ancient and medieval mathematics of Hindus. With modern mathematical analysis Europeans built up a mathematical edifice as high as a tall skyscraper. Obviously, the base of the skyscraper is underground and is invisible whereas the higher stories are seen everywhere. If Indians are disappointed by the invisibility of their achievements, the best course open for them is to build a skyscraper taller than the European and American ones by adding a few more stories to theirs. But this task is not going to be easy nor can it be done by going back to Vedas. The only hope is in the future course of history. The lessons from history point out that what was thought to be impossible at one time becomes possible at some future time. And, this realisation should spur us to rare devotion and dedication to mathematics and not to the Vedas. After all, truth, knowledge and virtues are a monopoly of no nation or an individual. They belong to those who single-mindedly dedicate and devote themselves to noble endeavours.

Ideology as Contagion

Madhava Prasad

ARVIND RAJAGOPAL's clarification letter (*EPW*, August 13, 1994) regarding his analysis of an advertisement in an earlier article ('Ram Janmabhoomi, Consumer Identity and Image-Based Politics', *EPW*, July 2, 1994: pp 1659-68) only exacerbates the methodological problems instead of doing anything to rectify them.

There are many problems with the essay, not all of which are germane to what seems to me to be the main methodological issue. For instance, the definition of communalism keeps shifting throughout the essay and the most objectionable version equates the rise of communalism with "the expression of relatively new, vernacular elites vying for power against older, more often English-educated elites, although the last few years have seen a blurring of this distinction, with more and more educated professionals espousing communal views" (p 1660). This does not tally with an identification of caste, elsewhere in the article, as the axis of division of the polity. It also enshrines as a sociological truth an Anglophone-prone prejudice according to which the Anglophone Hindu is the degree zero of caste identity. Secondly, Rajagopal's caution about the functionalist temptations of an 'economistic' approach is ritualistic rather than well thought out. His appeal for the investigation of desire and agency remains a guideline for the future, since such a possibility is negated by equating/reducing it to the study of meanings. Lastly, the article leaves one with a sense that its own unity is dependent on the existence of the master signifier 'Hindutva', which stitches together a wide variety of fragments of analyses, impressions, observations, statistics, etc, just as, by his own reading, the same master signifier quilts together a wide range of images and ideas to constitute a field of politics.

Rajagopal's basic, though unstated, premise, which I consider a product of the 'mass communications' approach he adopts, can be termed an epidemiological thesis on ideology. According to this, cultural products and human minds are merely the carriers of ideology, whose transmission they enable. A popular strand of North Atlantic sociology favoured this body-snatcher model of ideological capture. It now seems to have acquired new uses.

Thus the author avers that liberalisation and consumerism "created... new spaces into which communal discourse inserted itself" through "adaptation and encroachment" (p 1659). The basic formula of the discipline of mass communications research establishes a relation between message, medium

of transmission and destination. In this relation, the first two entities retain their original form. The message does not undergo any change in the course of transmission. The medium itself remains a neutral relaying mechanism. It is only the point of reception, the individual who receives the message, that undergoes a transformation, becoming infused with the message and becoming the agent of its further unfolding. The cause – the discourse of communalism – thus produces effects in the social-violence and destruction – through a channel of communication.

It is this naive theory of causality that leads Rajagopal to seek out empirical evidence in the form of market response to back his reading of the Greaves advertisement. To question the logic of the reading – which ascribes meaning to the saffron colour of the sunset – would only be to invite a pluralist defence ('That's just your opinion'). Instead let us look at the unstated assumptions (or unrecognised implications) behind the reading strategy. The starting point for the 'suspicion' of infection appears to have been the discovery that the company which produced the advertisement had also been engaged by the BJP for its campaigns. This could either mean that the virus, taking advantage of the proximity, transmitted itself to a non-BJP

advertisement that was being put together at a nearby desk, or that the management of the ad company was favourably disposed towards the BJP ideology and undertook to do its mite for its propagation by infusing it into its other products, much as a shopkeeper, if suitably rewarded, might prominently display and encourage the sales of a particular brand of commodity. The problem with the second thesis is that it would require a demonstration that at least some of R K Swamy's other advertisement from this period show symptoms of a similar infection.

Further, it is possible that the author is implying a coincidence of sympathies between the BJP, the ad company and the management of Greaves, so that a programme of subliminal communication could have been devised with the active consent of the industrialist. In which case the industrialist will have to be accused of a level of commitment to Hindutva ideology that induces him to risk losing the support of non-BJP investors. We cannot, of course, rule that out. But that would imply that the message is concealed. Which gives rise to a further complication: in the first place, why conceal a message behind such an elaborate (one might almost say foolproof) alibi? What are the chances that the meanings intended will communicate themselves selectively only to those who are predisposed to receive it? To any reader, two strategies might suggest themselves: to abstract from the text the concealed messages like 'ancient

MADRAS INSTITUTE OF DEVELOPMENT STUDIES

Applications are invited for the post of Director of Madras Institute of Development Studies. The Institute, which comes within the purview of the Indian Council of Social Science Research, has a faculty drawn from different disciplines in the social sciences and committed to the pursuit of research with a central focus on developmental issues. The applicant should have a pronounced academic orientation which she/he should be able to combine with administrative skills and a vision for the future in the running of an institution with a broadly liberal agenda that allows for a plurality of points of view and disciplinary specialisations. The appointment will ordinarily be for a period of five years, and the applicant shall be less than fifty-five years of age in January 1996 when her/his tenure will begin. The post carries the salary of a Professor under the UGC scales, a special Director's Allowance and subsidy for house rent. Applications, accompanied by *Curriculum Vitae* and the names of two referees, may be sent *before end of April* to:

The Convener, Search Committee,
Madras Institute of Development Studies,
79, Second Main Road, Gandhinagar, Adyar,
Madras - 600 020.

civilisation', 'symbols of the past', etc. and then, in a second movement, apply them to their own surroundings, thus eliminating the material presence and signifying force of the Egyptian pyramid, making it a transparent carrier/host of a message in transit: this is what Rajagopal's reading assumes; secondly, the reader might feel too strongly the presence of the pyramid itself, and depending on his/her inclinations, may either receive the message for what it is worth, or be affected by the alienness of the symbol, and develop a hostility to this Indian company for ignoring the symbols available here and going all the way to Egypt (a Muslim country at that!).

Whichever way you look at it, we are dealing here with a viral infection, a serial process of causality in which a manipulative ring of conspiring communalists releases a virus into the social body and reaps a harvest of infected minds.

Not surprisingly, Rajagopal's essay unconsciously echoes the discourse of epidemiology so consistently that even the general theory of the social that he builds to explain the process of communalisation is informed by it. Thus he establishes an opposition between commitment and communication. This equation (i.e. absence of commitment = communication of diseases) became a discursive common place in the US in the course of a moral campaign to prevent the spread of AIDS. Lack of commitment in relationships meant a high turnover of sexual partners, indicating moral degeneration, breach of communal and familial bonds and a resultant erosion of moral values. Such developments created new spaces where the AIDS virus could propagate itself, according to this thoroughly ideological explanation.

Rajagopal's theory equips itself with a similar explanation for the spread of communalism. Not only does the media serve as an instrument of dissemination of diseases, it is in itself a social affliction. He posits a process of erosion of commitment and the consequent opening up of the social field for the spread of communal ideology. "With the growing distance between lived experience and public culture, however, the commitment implied by audiences' consent no longer has the guarantees personal presence would entail. Commitment then becomes far more fluid and mobile, being based more on the gratification different images afford than on any investment of personal resources" (p 1660). This transformation of 'commitment' into a changeable, promiscuous thing makes it possible for a "highly disciplined and organised force like the RSS" to "exploit this altered form of commitment to present its own politics as representing those of the public at large" (p 1660). This 'explanation' fails to indicate what

makes the commitment-free space more receptive to the RSS ideology than to any other. I suspect that the words "highly disciplined and organised" are supposed to provide the absent justification. In other words, a discourse's success is a direct result of the strength and resourcefulness of the disseminating body. There is again, here, a tendency to regard a complex, transformed social field as reducible to a three-term equation. Disseminating agent → field of communications media → uncommitted subject. (Part of the problem might arise from a disciplinary will to elevate the object of mass communications research to a position of pre-eminence in the social.) The villains of the piece are distancing and impersonalisation. "Thus individuals may shift from one form of identity to another without necessitating a proportional shift in the distribution of their resources" (p 1666).

The last quotation points to the discursive reduction at work in the essay. Having abandoned the 'economism' of class-based explanations, Rajagopal treats Hindutva as an ideology whose dissemination can be accomplished without loss of social position, without a transformation of

personal life. This is perhaps true of the proponents of E-mail fascism but the entire phenomenon of Hindu nationalism cannot be explained (away) by recourse to this one idea. For most of the new adherents of Hindutva, no such security against transformation of personal life exists. Rajagopal's assumption that the English-speaking segment of the population is free from communal passions and his consequent surprise at what he considers a 'recent' change in its character may have led to the explanatory priority given to a purely discursive, 'gratificatory' relation to Hindu nationalism.

It is doubtful whether the vicarious pleasures of non-committed voters (Advani's use of this term is consistent with its meaning in political journalism and can only be accommodated to Rajagopal's definition by force) can serve as the main support base of a party whose politics has involved unimaginable levels of violence and planned confrontation with a weak transitional state. But having swept political economy under the carpet and isolated discourse and its vicissitudes as the sole object, Rajagopal could not have reached any other conclusion.

SAMEEKSHA TRUST BOOKS

Selections of Articles from *Economic and Political Weekly*

General Editor: Ashok Mitra

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Here's one investment plan that takes care of four others!

*Tax Exemption. • Annual Dividend and Maturity bonus.
• Life Insurance Cover. • Free Accident Insurance.*

ULIP (Unit Linked Insurance Plan) from UTI is a single-window investment plan catering to more than one financial priority. Consider the benefits offered:

Tax Exemption: When you invest in ULIP your investments qualify for tax exemption under section 88 of the Income Tax Act. Moreover, investment made in the name of spouse and children is also eligible for tax exemption now.

Annual Dividend and Maturity Bonus: The annual dividend is reinvested in the plan. There is also a maturity bonus of 5% on the 10 year plan and 7.5% on the 15 year plan respectively. The annual

dividend for 1993-94 was 16.5%.

Life Insurance Cover: An insurance cover equal to your target amount without a medical examination. This cover is effective 6 months after you invest in ULIP.

Free Accident Insurance: An additional Rs. 30,000 accident cover, irrespective of your target amount.

Target Amount And Plan Period: You can choose either the 10 year or 15 year plan and aim for a target amount between Rs. 6,000 and Rs. 60,000.

For further details, please contact your nearest UTI branch, Chief Representative or agent.

UNIT TRUST OF INDIA

For your better tomorrow

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of the future results. Unit Linked Insurance Plan is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospects or returns. There is no guarantee that the Fund's objective will be achieved. Please read the offer document before investing.

Vol XXX No 12

March 25, 1995

Globalisation and Nation-Building

With the advent of globalisation, the changes taking place at the bottom tiers of nations have received little attention. Yet shifts in power relations, allegiances and consciousness at various levels of civil societies are changing the world as much as, if not more than, the macro changes wrought by international capital, technology and the mass media. To what extent these new cultural assertions of identity will enable the peoples of various regions to face the new capitalist order remains to be seen. 625

Women's Rights in Agricultural Land

Though the Constitution promises no discrimination on the basis of sex as a fundamental right, most inheritance and ceiling provisions relating to one of the most important economic resources in the country continue to be highly gender discriminatory. And the Ninth Schedule lends itself to their perpetuation. These aspects which impinge directly and crucially on women's legal and economic status have received surprisingly little attention from either researchers or activists. A-39

The Budget: Long on Rhetoric

The 1995-96 Budget is a desperate attempt to postpone the day of reckoning in the last year of the government's tenure. 601

The budget proposals fail to advance the objective of moving towards a simpler, fairer and less distortionary tax system which the finance minister professes to pursue. 603

The outlook for the Indian economy in 1995-96: forecasts by a macro-economic model. 639

Agricultural Growth

Production and productivity growth in Indian agriculture in recent years cannot be attributed only to favourable weather. The improvements in yield and the relatively wide dispersal of growth across regions and crops point to a technologically dynamic growth process. A-2

India's goal of self-reliance in the oilseeds and vegetable oils sector does not appear beyond reach any more in view of the acceleration of growth achieved in the past few years. A-14

Environmental Dimension

Sustainable agriculture involves not only the identification and application of improved technologies but the incorporation of ecological and socio-economic considerations. Inevitably conflicts and contradictions arise. A-21

The state government's policy of having major irrigation projects in all the river basins in Kerala is based on neglect of specific agro-climatic and agro-ecological features of humid-tropic Kerala. A-30

The fisherfolk and peasants of coastal Tamil Nadu are organising themselves against the encroachment of prawn farming which is adversely affecting the environment and their own life chances. 607

Anti-Theory

The postmodernist denigration of theory and of disciplinary grids as 'fictions', of one kind or another, has significantly influenced a wide range of scholarship. But it is in contemporary feminist studies, more than anywhere else, that this intellectual attitude has been fully realised. 617

Structural Weakness

Though Kerala has a relatively high proportion of rural non-agricultural employment, the emerging occupational structure is weak, as reflected in its inability to take advantage of the growth impulses generated by increases in demand. 634

Power Play

Kremlin's decision to pit Russia's entire military might against the Chechen rebels, supported as it was by the US and approved by the European governments, reveals the rough outlines of an emerging multi-power world. 613

Economies in Distress

With declining investment and profligate non-developmental expenditure, UP's economy is in the doldrums. 609

Much has been said about the impact of external liberalisation on the Indian economy as a whole, but what about the economies of individual states? The harsh prospect for Tripura. 604

A Strangled Cry

"WE the Marxist Communists deserve brickbats and not bouquets", Nripen Chakraborty, the octogenarian freedom fighter and veteran communist and member of the politburo of the CPI(M), bitterly told the Congress(I) delegation who came to offer him a floral tribute at his hospital bed in Calcutta. The Congress men were having the time of their lives. The day before, Nripen Chakraborty had unburdened his heart to an interviewer from a local Bengali daily: The Marxist Communists in West Bengal have thoroughly degenerated – morally, politically and intellectually. The state government was pursuing an anti-labour policy. The new economic policy of the Left Front government was a gimmick and the party's mouthpiece, *Ganashakti*, could not be read 'without revulsion'; there was not an iota of Marxism-Leninism in it.

It was a strangled cry, devastatingly accurate. The entire leadership of CPI(M) both at the state and all-India levels were struck dumb. Chakraborty retained the dignity of the idea and could not yet get rid of his hatred and contempt for a different way of life of ease, safety, toleration and complacency. He could yet see the thoughts, hunger and hope and hatred in the eyes of the people. He had not the kind of dwarfed dignity which the other veterans were accustomed to – the dignity of people afraid of a little pain and yet sitting with firmness in their chairs.

This is not to idealise Nripen Chakraborty. One is astonished at his innocence. Was he not aware that participation in the administration paralyses the revolutionary will of the working class, that so-called relief under the present relations of production proletarianises the masses still more? It does not offset the imbalance of income between workers and capitalists. It only redistributes wages among different groups of workers. The party's preoccupation with wage restraint since it came to 'power' reflects Indian capital's anxiety about the trend of declining profit rate. But, as Marx pointed out, this decline does not necessarily lead to a decline in the mass of surplus value. Over-accumulation of capital in the hands of the owners has been an integral part of every capitalist crisis and is a prime factor in the waves of speculation that precede and sometimes accompany large-scale declines in mass purchasing power. It is time our

economists calculated what a huge percentage of the money in circulation was in speculative operation and not in production. The figure would be fantastic. The removal of all controls on cross-border capital flows is an indication of how anxious the owners of capital were to valorise their holdings in ways that did not involve investment in local industry – not to speak of West Bengal industry. It is not a question of centre-state relations but mainly and essentially a question of the crisis of capitalism, of class relations. 'Class' is now a forgotten or forbidden word. Nripen Chakraborty's cry is the belated expression of the self-flagellation of the honest among the communists. The workers the world over, with the temporary prosperity of the post-war years, have become compromisers and ceased to be revolutionaries. The severe chastisement by crises is bestirring the mass of them again now.

Intellectual Property Rights

'INTELLECTUAL Property Rights: An Indian Perspective' (February 4) by DM Nachane merits attention and discussion. Whatever one might say, intellectual property rights is a powerful weapon for

marketing of technology on the terms and conditions of the seller. This must be resisted as it defeats the established norms of fair trade practice to ensure protection of the buyer. In this context LDCs are helpless buyers. It also tends to make the future insecure for LDCs.

IPR is being forcefully implemented in the name of the inventor and technology. Nobody is asking if the inventor has freedom of expression. As we know, technology, in spite of its continued refinement, cannot prove helpful, unless it is accompanied by a corresponding behavioural change on the part of society. Have the promoters of IPR or the scientific community taken this fact seriously?

It must also be appreciated if any law or rule (including the IPR) is made strict and forcibly implemented, it would lead to violation. We have not heard many cases where infringement of IPR has been successfully curbed by a judgment of a court of law.

More than in LDCs, infringement of the IPR is occurring in the developed nations. None seems to have been punished. It is for such reasons that industrial security is gaining great importance. The monopoly product producers and many multinationals are watching helplessly and their competitors are coming up fast by infringing IPR and patents.

Command Performance

FOR the ruling party at the centre, the Tenth Finance Commission was very much an in-house affair. The chairman was a veteran Congress stalwart whose residual, but high, ambitions for holding a major political office were smothered by developments in Uttar Pradesh. He had to be accommodated; he was. Two other slots were filled by an economist and an economic administrator with long official links. And as far as the convention of having a distinguished judicial personality as a member so as to enable the commission to decide upon financial dispensations with dignity and detachment was concerned, the Tenth Finance Commission broke altogether new ground. A member of parliament, currently serving in the Lok Sabha, and a practising lawyer in the Supreme Court and in the Calcutta High Court, was picked for the slot. A formal explanation for the extraordinary choice was not lacking either: the gentleman, the nation was informed, had, once upon a time, served for some months as puisne judge in one of the country's high courts.

After such a composition, little, very little, could have been expected to emerge from the deliberations of the Tenth Finance Commission. That assessment has not been belied. Mercifully the report the commission has submitted is not long on verbiage. What it has to say it says with an admirable economy of words. That apart, what little it has to say is an echo of the traditional views of the union government, mostly reflecting the post-independence stance of the Congress Party towards centre-state relations. The undercurrent of impression the report of the Tenth Finance Commission exudes is that the centre is the centre of the universe and the states are a near-insufferable nuisance.

The problem, however, does not lie with Article 280 of the Constitution, which sets forth the procedure of appointment and mode of composition of the quinquennial finance commissions. The core of the problem has its nexus with Article 74: under all circumstances the president will have to act, it says, according to the advice of the council of ministers adorning the union government. The finance commission, given its principal responsibility, to decide the distribution of shareable tax proceeds between the centre and the states and grants-in-aid from the Consolidated Fund of India to the states, has to fill in the role of an arbiter. But one party in the arbitration, the union government, decides the commission's composition as well as the terms of reference for it. In course of time the ministry of finance has assumed that the commission has no other assignment to look after except to do North Block's bidding. The assumption has been duly validated by the turn of events as the decades have rolled by.

Forget for the present the Tenth Commission's discourses on how the country's fiscal framework ought to be restructured beyond 2000. Consider its recommendations for the period 1995-2000. The states, thanks to the awards of the preceding commissions, had till now been enjoying an 85 per cent share of the proceeds of income-tax. That share has been brought down by the Tenth Commission to 77.5 per cent. It will be said on its behalf that, never mind, the share of union excise duties given to the states has been simultaneously raised from 45 per cent to 47.5 per cent. But the fact is that, with the drastic slashing of rates of excise duties the finance minister is bent upon pursuing, the marginally higher allocation to the states may be altogether of a chimerical quality. What is being lost on the swings would then not be compensated on the roundabouts.

Perhaps that denouement would be in conformity with intentions. Even more bemusing is the commission's decision to abolish the additional excise duties on sugar, textiles and tobacco and tobacco products and to merge this tax head with basic excise duties. The commission has added the ukase that despite what it has proposed, the states would have no right to levy sales tax on these categories of commodities. But have the legal and constitutional implications been fully gone into? The commission was not the judiciary; it did not have the prerogative to write the law or rewrite the Constitution. The additional duties of excise on textiles, sugar and tobacco and tobacco products were in lieu of the states' taxes. Once, as a result of the Tenth Commission's verdict, this arrangement is terminated, the right to levy sales tax on these commodities should automatically revert to the states. The commission would not like that to happen and has recommended an amendment of the Constitution so that its direction becomes operational with effect from the fiscal year 1996-97. The commission has obviously been either ignorant or oblivious of the country's changing political geography to assume that the constitutional amendment sought to be introduced can be enacted in the course of the next few months.

The rest of the recommendations of the Tenth Finance Commission, such as with respect to debt relief, grants-in-aid, grants in lieu of tax on rail passengers, grants to local bodies, maintenance outlays, etc, are run-of-the-mill. The suggestion for establishing a calamity relief fund has the aura of an innovation, but the modality of who will operate the fund and under what procedures is left tantalisingly vague. Finally, it is most unlikely that the commission's longer range proposal to pool all central taxes together and permit the states to partake of 26 per cent of the total would have many buyers. It will be seen as a ploy, and a pretty transparent

due, to further centralise an already excessively over-centralised tax-sharing arrangement. The formula by which the commission decided that not 27 per cent, not 25 per cent either, but exactly 26 per cent would be the prerogative of the states under the proposed new fiscal system is not easily explicable. Given the fast pace at which the country's political map is getting altered, it would be no surprise if sooner or later, sooner probably than later, the states demand in unison that the yield from all taxes levied by the centre should be shared with the states on a 50:50 basis. After all, as early as in the early 1970s, the CPI(M) actually went to town in West Bengal with the electoral slogan of a three-fourths allocation for the states from the central tax kitty. Some chief ministers might in the coming years not be averse to suggesting that, with the corporation tax and taxes on foreign trade, they would not mind a pooling arrangement as per the recommendations of the Tenth Commission, but what the share of the states would be from out of this pool was to be a matter for settlement in the political arena.

On the more basic issues afflicting centre-state fiscal relations the Tenth Finance Commission has little to say. It was conceivably under specific instruction to remain taciturn on the role of discretionary transfers which the ministry of finance has become so addicted to in the past couple of decades. The plan transfers, that is, transfers according to the recommendations of the Planning Commission, were never of a significant magnitude; with the ruling party's discovery of the so-called 'special category states', plan transfers for the overwhelming majority of the states were reduced to tokenism. But it is the other fact, that of statutory transfers under the finance commission's dispensation being increasingly dwarfed by the ministry of finance doling out funds for its favourite causes under Article 282 which should be the focus of attention on the part of those who are interested in the evolution of a non-overcentralised, democratic fiscal system. The Tenth Finance Commission has chosen not to venture into such, to it forbidden, territories. Nor has it any comments to offer on the increasing tendency of the centre to deduct from the statutory dues of individual states, as determined by the awards of finance commissions, amounts which it thinks such states owe to it. The funds which come to the states on account of finance commission awards are in the nature of trust funds; these may at any point of time lie in the Consolidated Fund of India. But constitutionally these belong to the states; the union government, as a mere trustee presiding over the Consolidated Fund, should not have the right to interfere with or appropriate from such monies for its own purposes. This is an extremely serious issue; not however according to the Tenth Finance Commission.

But the commission's had to be a command performance. That objective reality must also have stood in the way of it offering any worthwhile comments on the mysterious affair of the tax on consignments, a proposal for introducing which was unanimously decided upon at a conference of chief ministers more than a decade ago. There are, of course, parallel fiscal visions, such as of those who cannot wait to see India emerge as a unified, integrated, single homogeneous market over which the value added tax would reign supreme and the abomination of sales taxation would be a relic of the abominable past. Visions, however, are theoretical constructs; the country may come to nurture altogether different, even if rather less tidy, practical propositions.

CONGRESS PARTY

Growing Rumbblings

THE resignation of UP Congress leader N D Tiwari from the Congress Working Committee (CWC), which has infused fresh blood into the ongoing crisis in the party, is significant in several respects, although it is premature to say that it would lead the party towards a split.

The resignation has come at a time when the Congress had only recently suffered humiliating defeat in two major states, Maharashtra and Gujarat, which, coupled with the rout of the party in Karnataka and Andhra Pradesh earlier, has made the position of the prime minister and the party president P V Narasimha Rao particularly vulnerable. This vulnerability of Rao, and of the coterie around him, explains the cautious and, in fact, appeasing reaction in the higher circles in the party to Tiwari's resignation.

Another reason for this mild reaction is that apart from his seniority as a party leader, Tiwari, unlike Arjun Singh, has a reputation for honesty and probity in public matters, for which he is respected by the party rank and file. However, these traits of his political personality, in the wake of his resignation, have a much more serious implication for the dissidents rather than the mainstream of the party: they have the potential to establish him as a serious challenger to Arjun Singh, whose moral stature is not beyond reproach, for the leadership of the dissident camp. It would not be entirely surprising, therefore, if this becomes a contentious issue for the Congress dissidents in the coming days and months.

An aspect of the Tiwari resignation which has totally escaped attention is its impact on the Congress in Punjab and particularly on chief minister Beant Singh's leadership of the state party. It should be recalled in this context that Tiwari's resignation had followed remarks by Beant Singh and by Balram Jakhar, another Congress leader

from Punjab, that disciplinary action would be taken against him if he attended the dissidents' rally in Bhatinda on March 23. What is significant is that Beant Singh and Jakhar, member and vice-president, respectively, of the party's Disciplinary Action Committee (DAC), had made these remarks because Tiwari's presence in the rally, where Arjun Singh was also to speak, would have strengthened the position of Jagmeet Singh Brar, dissident Congress MP from Punjab and organiser of the rally, in the state party. Brar, a relatively young leader, who has become a thorn in the side of the state party leadership, has been trying to emerge over the years as a serious contender for the top party post in the state. This prospect is unpalatable not only to Beant Singh but also to Jakhar whose son is a minister in Beant Singh's government. Thus, Beant's and Jakhar's remarks which, originating in a regional political context, have bolstered the crisis in the party at the national level. Nor have these two leaders succeeded in realising the intent behind their remarks. On the contrary, the prominence that the Bhatinda rally – which was, in the event, largely attended – acquired due to the controversy has only served to strengthen the position of Jagmeet Singh Brar.

TAX BUOYANCY

Beyond Compliance

A CONSTANT refrain of the finance minister and his officials has been that the last budget's reduction in marginal tax rates on personal and corporate incomes have yielded good results. As the finance minister has emphasised in his latest budget speech, the receipts from personal income and corporation taxes together are expected to increase by more than 25 per cent in 1994-95 and the share of direct taxes in GDP to rise from 2.1 per cent in 1990-91 to 2.8 per cent in 1994-95. The *Economic Survey* for 1994-95 has tried to drive home this point more vigorously. Arguing that the cumulative effect of the decline in marginal income tax rates in the past four years has not reduced tax revenue as feared by some, the *Survey* states that the overall effect of the reforms has been to raise buoyancy of both personal and corporate tax revenues (with respect to GDP). Personal income tax buoyancy has averaged about 1.4 during 1991-92 to 1994-95 (BE) against 1 during the previous four years, while corporate tax buoyancy has similarly risen from 0.8 during 1987-88 to 1990-91 to around 1.7 during 1991-92 to 1994-95 (BE). As the revised estimates of revenue from these two taxes are higher than the budget estimates, the buoyancy figures for the latter period should be even higher. Even if the increases in tax revenues are related to GDP originating in the non-farm sector (that is, other than

agriculture, forestry and fishing), the improvements in buoyancy noted above are still valid: 0.87 for the first period and 1.05 for the second period in respect of personal income tax and 1.82 and 1.36, respectively, for the corporation tax. It is also true, as claimed in the *Economic Survey*, that the share of direct taxes in the centre's gross tax revenue has improved from 19.1 per cent in 1990-91 to 28.4 per cent in 1994-95 (RE) and further to 29.2 per cent in 1995-96 (BE).

While all this may be true, how valid is the claim that the improved tax buoyancy is the result of reductions in marginal tax rates and simplification and rationalisation of the tax system and administration? Mere juxtaposition of aggregative data on tax revenues and GDP is not enough. There is, in fact, evidence pointing in a somewhat different direction.

Let us take trends in corporate tax revenue. In the past four years, the largest rise in it from Rs 5,335 crore to Rs 7,835 crore or by 47.20 per cent took place in 1991-92. That was the year when the marginal tax rate for the corporate sector was raised from 40 to 45 per cent for widely-held companies and from 45 to 50 per cent for closely-held companies. The finance minister had declared then, "I feel disappointed that the phenomenal growth in the output, value added and profits of the corporate sector, in recent years, has not been appropriately reflected in corporate tax collections". In the same vein, arguing that the rates of depreciation prescribed in 1987 on plant and machinery were too generous and provided much more than was needed to compensate for wear and tear, the finance minister reduced the general rate of depreciation for plant and machinery from 33.33 per cent to 25 per cent. These increases in rates gave the above-noted jump in corporate tax revenue in 1991-92. The next two years saw only a rise of 13 per cent each in corporate tax revenue and buoyancy with respect to non-farm GDP remained below unity (0.91 to be exact). It is in 1994-95 that there has again occurred an improvement of 31.7 per cent, from Rs 10,060 crore to Rs 13,250 crore (RE), though tax rates on companies were slashed to a uniform rate of 40 per cent for both widely-held and closely-held companies. In the case of companies incorporated abroad, the rate was reduced from 65 per cent to 55 per cent. Capital gains tax on companies was also reduced from 40 per cent to 30 per cent. The conventionally estimated revenue loss on these counts was estimated at Rs 1,355 crore, whereas the revised estimates now show a rise in collections of Rs 3,190 crore, an increase of 45.2 per cent.

Significantly, similar buoyancy has been seen in personal income tax receipts in 1994-95 when there was some reduction in income tax on individuals. The estimated revenue rose by 20.7 per cent from Rs 9,115 crore in 1993-94 to Rs 11,000 crore in

1994-95 or by Rs 1,885 crore. Considering that the loss of revenue on account of the tax reductions had been placed at Rs 1,075 crore, the effective rise in income tax revenue worked out to 32.5 per cent.

While it may be true that the above increases to an extent do reflect the effect of improvement in tax administration, it is doubtful if voluntary compliance by taxpayers has improved as a result of moderation of tax rates. A review of the performance of the economy in the past two years suggests other possible reasons.

First, studies on corporate finances show that a large number of companies garnered sizeable pre-tax profits in 1994-95 because of three factors: (i) large increases in sales turnover of manufacturing firms, (ii) massive profits made by these in non-manufacturing activities which are reflected in a quantum jump in 'other incomes' consisting of interest and dividends, as also in non-operating profits by sale of physical and financial assets; and (iii) a substantial step-up in profits of public and private sector corporate bodies in the financial sector. A study of the unaudited financial results of 2,017 companies comprising 1,982 private sector companies and 35 listed PSUs for the first half of 1994-95 shows that their combined net sales rose by 25.2 per cent, their 'other income' by 46.4 per cent and gross profit by 32.6 per cent. As interest and depreciation provisions rose only by about 5-6 per cent each, profit before tax shot up by 75.5 per cent. As a result, these companies' provision for direct taxes is higher by 27 per cent. Companies producing commercial vehicles saw their gross profit rising by 156 per cent and tax provision by 474 per cent in the first half of 1994-95 and those producing passenger cars and jeeps by 104 per cent and 1,083 per cent, respectively. Such sharp increases in profits and in tax provision are seen in a number of other manufacturing sectors. Data on financial sector companies and banks for 1994-95 are not available but it is known that financial sector activities, including treasury operations of commercial banks and term financing and investment institutions, got a boost from the surfeit of liquidity emanating from inflow of foreign portfolio investment. This must have produced massive profits and enhanced tax payments by players in the capital and money markets.

Secondly, this has also been a period when executive salaries in financial as well as non-financial companies have gone up phenomenally. A rise of about one-third in income tax collections was to be expected even as per conventional behaviour of income tax-payers (excluding some collections from presumptive taxation).

In effect, certain special factors have been responsible for the higher profits and incomes and higher tax payments in 1994-95. To an extent, tax evasion in capital market and financial dealings is more

difficult than in manufacturing, trading and the professions. If the government were to put out more disaggregated data on the number of assesseees and their gross incomes and tax payments, including those by professionals like doctors, lawyers, architects and contractors, it might turn out that it is not improved compliance and collection that is responsible for higher direct tax revenues, but the sudden emergence of a large category of high-income earners among the upper middle classes as a result of economic liberalisation, in the financial sector in particular.

HEALTH BUDGET

Roller-Coaster Ride

IT is hardly surprising that the 1995-96 Budget places negligible emphasis on the health sector. A budget which has ensured further deterioration in the parameters of health for a growing number of people cannot be expected to strengthen short-term technical preventive and curative services. Even apart from the larger socio-economic base which determines health status, budget allocations for items such as the integrated child development scheme under social welfare barely keep pace with the rate of inflation. The allocation for rural water supply has gone up by 37 per cent, but the allocation on sanitation remains the same. Clearly, the funding of social welfare programmes is not based on an integrated concept of people's well-being, but on piecemeal hikes, motivated by considerations other than welfare. Even if some of these programmes are supplemented by separate state programmes, the centre's cuts combined with poorer overall transfers to the states ensure their gradual attenuation.

Even the rhetoric on the need to provide good health care, is missing today. By allocating Rs 1,048 crore to 'medical services and public health', that is, 5.5 per cent more than last year's revised estimates, in other words a reduction in real terms, the union government has signalled its continuing withdrawal from the health sector. In some areas there is a reduction even in nominal terms, such as for 'medical education, training and research', from Rs 293.84 crore to Rs 277.77 crore. Within this an institution like the Indian Council of Medical Research, which is meant to provide direction to and organise medical research and has suffered long neglect, has this year been allocated a minuscule Rs 49 crore, just Rs 0.82 crore over last year's budget. Not surprisingly, the direct and indirect consequence of this is that programmes considered to be of relatively low priority suffer. The ICMR, for instance, has wound up all its research programmes related to the Bhopal gas disaster. The haphazard manner in which the health budget is put together also results in there being no

consistent and secure funding. For instance, cancer research received Rs 19.80 crore in the 1994-95 budget for setting up peripheral detection centres, etc; however, the revised estimate of Rs 43.80 crore indicates that lump sum funding was received for particular projects. In 1995-96 the budget allocation of Rs 16.88 crore is even less than the original 1994-95 allocation. Inevitably, ongoing projects will either have to look to other sources for funds or be disbanded.

Public health allocations continue to trace the same roller-coaster curves which have been long characteristic of the central health budget. Of the allocation for disease programmes, the largest single component is the Malaria Control Programme for which the states contribute an equal amount. This is not surprising given what appears to be a rapid spread of the disease, especially in more virulent forms, and its debilitating effects. Malaria is a disease whose spread is directly related to poor development planning – urban and rural, agricultural and industrial. Funding a disease control programme without ensuring that the factors which make for the spread of the disease are not eliminated is like trying to repair a leaky bucket with the tap turned on. Within the AIDS control programme the older STD control programme, which has now been merged with it, has consistently suffered declines in allocations, getting Rs 0.50 crore in 1993-94 and Rs 0.18 crore in 1995-96. The tuberculosis control programme received a new lease of life with the onset of AIDS. WHO has now recommended a supervised treatment programme using more expensive drug regimens. The higher allocations will no doubt go towards paying for the increased cost. However, detection and follow-up of patients requires an efficient primary health care set-up which, ironically enough, is being systematically disbanded by the squeeze on health care allocations. A different example of the haphazard approach to the health sector is the higher allocation for the National Institute of Communicable Diseases, no doubt the result of the institution's inadequacies coming into the limelight during the plague epidemic.

At this rate in a few years there may be no central health budget to comment on, the states taking care of the minimal public programmes and the entire curative sector being pushed into the private sector with a network of private health insurance companies.

THE DOLLAR

Other Countries' Concern

FIRST it was thought that the yen-dollar exchange rate would not be allowed to go below 100 yen to the dollar; now that it has fallen below 90, the question is how much lower it would be allowed to sink. Not that

attempts have not been made to jack up the rate to over 90, but the outcome has not been quite successful. With the US trade deficit reaching a record level, early hopes of raising the dollar's exchange rate seem to have given way to a sort of resignation that it will be difficult to push it back to 90 yen or above.

Interestingly, practically all attempts to jack up the dollar have emanated from quarters outside the US. Monetary authorities in the US have virtually turned a deaf ear to all the concern over the depreciation of the dollar. On the other hand, monetary authorities of other countries, particularly Japan and Germany, in respect of whose currencies the dollar has suffered the maximum decline in recent weeks, have had to shoulder the brunt of the action to stem the tide of a declining dollar – action which has taken the form of intervention in the exchange markets and/or interest rate reduction. These actions could certainly be said to have slowed down, if not stemmed altogether, the dollar's decline.

The question remains, however, whether the fundamentals, so-called, are slated to push the dollar further down against the other major currencies. If by fundamentals one refers to trade and current account balancing, the dollar should have been in the dumps long, long back. But the US has enjoyed a special position in the world of international finance, particularly since the second world war, because of the role the dollar has assumed as a reserve currency, first under the Bretton Woods agreement and even later after the Bretton Woods arrangement more or less collapsed, at least insofar as it was premised on the fixed exchange rate system.

The basic question to ask therefore is whether the reserve currency role performed by the dollar is likely to come more and more under attack. In this context, it is well to bear in mind that while other countries with strong currencies, such as Japan and Germany, have been reluctant to let their currencies take on extended reserve currency roles – principally, it would appear, for the fear that it would oblige them to surrender their freedom to regulate domestic economic policies – these are also the countries which along with the US have been the most vociferous in their opposition to the creation of an international reserve currency which is free from domestic economic compulsions. Germany and Japan have, no doubt, over recent years acquiesced in the use of their currencies as reserve currencies to a limited extent, but the dollar's dominance has stayed put with 60 per cent of the currency reserves of the monetary authorities (including India's) held in dollars. So long as this remains the position, the dollar's exchange rate is under no danger of collapse, certainly not in the manner of Mexico's peso. And in the circumstances why should the US not be indifferent to what happens to the dollar's external value?

UTTAR PRADESH

Repeat Performance

HARDLY had the threat created by N D Tiwari-Arjun Singh game plan to Mulayam Singh's government receded, the banned VHP, in its new incarnation of Hindu Sangam, decided to set astir the political waters of Uttar Pradesh. On February 27, the day of Mahashivratri, the VHP conducted a 'jalabhishek' at the Kashi Vishwanath temple in Varanasi as an initiatory step to 'liberate' the temple from the nearby Gyan Vapi mosque. Though the local Hindus and Muslims wisely kept away from the event and tight security arrangements prevented any untoward incident, the very launching of 'Kashi andolan' disturbingly indicates that the Sangh parivar has not budged from its divisive designs.

As was the case with the Ayodhya issue, the BJP, the political arm of the Sangh, has officially dissociated itself from the initial stages of the agitation. According to the Sangh strategy, which by now is an open secret, the various other fronts of the Sangh parivaar prepare the groundwork for the BJP to ultimately reap the political gains. Thus at the moment L K Advani may say that Kashi is not on the BJP agenda but by allowing Mahant Avaidyanath and Uma Bharati, the BJP legislators, to participate in their 'individual' capacities and indulge in aggressive rhetoric, he has left the door open to capitalise upon the issue as and when the time is considered ripe. Given the noticeable decline in the popularity of the BJP since the Ayodhya incident, Atal Bihari Vajpayee's categorical statement that all the wrongs of history cannot be undone, may guide the party policy for some time. Yet the influence of the moderates in the Sangh parivar is likely to fade in the face of another upsurge of extremism.

By proclaiming its support to the VHP stir, the RSS, on the one hand, aims to elevate the prospects of the BJP in the forthcoming Lok Sabha elections. On the other hand, by announcing its intention of supporting the Congress if the latter makes N D Tiwari the prime minister, the RSS not only desires to stoke the infighting within the Congress but also slyly lend credibility to the accusations levelled by Mulayam Singh against the Tiwari-Arjun Singh faction. The crisis in the Congress has certainly helped Mulayam Singh to strike a working relation with Narasimha Rao who recently approved a 20 per cent hike in the plan outlay for Uttar Pradesh. Mulayam Singh has also utilised the Kashi stir to further tarnish the Tiwari-Arjun Singh axis. Yet if Mulayam Singh plans to go for mid-term polls, it would be judicious for him to curtail his present polemics against Arjun Singh and concentrate his energies on squarely tackling the Sangh threat.

IDBI I-Nit

IDBI MUTUAL FUNDS is promoted by IDBI which has over three decades of experience in corporate lending and investment. IDBI Mutual Fund has announced its maiden scheme I-nit '95 specially designed for small investors. It is a growth scheme with a five-year maturity. It offers two plans: Dividend I-nits to offer dividend income through distribution of profits at the end of each year and growing I-nits to offer long-term capital appreciation through reinvestment of profits realised. The scheme offers periodic encashment facility under which investors can encash their I-nits at NAV. Encashment facilities would be offered once every six months in the first year and once every three months thereafter. A unique banking convenience is also offered to investors through a cash across the counter facility. For this the IDBI Mutual Fund has tied up with seven commercial banks. IDBI as the sponsor and lead manager has offered a safety net for the first time in a mutual fund scheme under which IDBI would purchase I-nits at face value for a period of one year from the date of allotment from original allottees subscribing up to 5,000 I-nits. The issue is to open from March 27 to May 6.

Monalisa Multiplast

Incorporated in 1994 and belonging to the Azam Plastic Group, Monalisa Multiplast is engaged in the manufacture of high fashion injection moulded plastic furniture like chairs and tables and also crates, storage bins, tanks, drums, etc. Marketed to households and industrial units the products are 100 per cent termite resistant. The company is entering the capital market with maiden public issues of 21,90,000 equity shares of Rs 10 each at par aggregating Rs 219 lakh. The funds would be used to set up manufacturing facilities at Daman for manufacturing 3,600 mt of injection moulded plastic furniture. The project being located in a centrally notified backward area, the company is entitled for 100 per cent income tax exemption for the first five years and thereafter 30 per cent exemption for the next five years along with sales tax exemption for the first five years. Since commercial production is to commence in April the project has almost no gestation period. The project has been appraised by SBI Capital Market and the cost is estimated to be at Rs 1.700 lakh. SBI is financing the project to the tune of Rs 500 lakh and State Bank of Mysore is providing Rs 300 lakh. The issue, slated to open on April 6, is being lead

managed by Times Guaranty Financials and Prudential Capital Markets.

Kadvani Securities

Kadvani Securities managed by K L Kadvani and A L Kadvani is operating in financial services and finance-related areas. In order to broad base its activities, the company is embarking on expansion of its activities in the field of shares and securities, leasing, corporate advisory services and project and management consultancy services. The company is already into trading in shares and securities and plans to enter leasing of industrial equipment and plant and machinery. Under corporate advisory services it plans to undertake arranging bill discounting, intercorporate deposits and fund placements for its clients. Project management and consultancy includes identification of profitable project opportunities, preparation of project reports, appraisal of project reports and credit syndication from banks and financial institutions for term loans, debentures and working capital finance. For this expansion the company needs to augment its long-term

working capital. The company is entering the capital market on March 28 with a public issue of 18 lakh equity shares of Rs 10 each at par aggregating Rs 180 lakh. Lead manager to the issue is Prudential Capital Markets.

Suprapti Plastics

Suprapti Plastics, a 100 per cent export-oriented unit manufacturing bags, stretch films and garbage bags has an installed capacity of 1,330 mtpa. The company has been promoted by Prashant Tanna and his associates. The company is entering the capital market on April 4 with a public issue of 37 lakh equity shares of Rs 10 each at par aggregating Rs 370 lakh of which Rs 56.38 lakh is to be firmly allotted to NRIs/OCBs and Rs 20 lakh to Mutual Funds. The project is to expand capacity to 1440 mtpa. The cost of the project is estimated to be at Rs 453.89 lakh. The gestation period is very low since commercial production from the expanded capacity is to begin in April. The company has signed an MOU with Lightways, London, for supply of its entire production for five years. Lightways also has an equity stake in SPL to the extent of Rs 48.62 lakh.

OUTSTANDING BOOKS

GATT ACCORD

India's Strategic Response

Foreword by

Pranab Mukherjee

Edited by

V. Ramachandriah

The General Agreement on Tariffs and Trade, GATT (1948) is the basis for a global rule-based trading system. GATT members agree to trade with one another on equitable basis, irrespective of the level and size of their economics or political system and to reduce barriers to trade.

This important book places the impact of GATT Agreement in proper perspective and offers proceedings and papers presented during a seminar organised by the Indian Institute of Foreign Trade, New Delhi, for the benefit of those interested in GATT affairs.

CURRENT STATISTICS

EPW Research Foundation

Prices of primary articles and food have receded somewhat over the past year. Reserve money growth has picked up as net RBI credit to the centre has started rising. The BSE sensx has registered a fall of about 27 per cent over the year's peak, losing 1,236 points. There has been a fall in the share of petroleum products and some rise in that of capital goods and metals in imports. In exports the shares of chemicals and cotton and manmade textiles, including readymade garments, have shown a rise. Capital goods exports have remained a little over 10 per cent. Foreign currency assets have again crossed \$ 20 billion.

(Figures in brackets are percentages to total)

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript ³ stands for March. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year.

FERRO ALLOYS CORPORATION

Exports Looking Up

INDIA'S largest manufacturer of ferro alloys and producer of quality steel, Ferro Alloys Corporation (FACOR) has been in the red for the past four years. Rising cost of production and stagnant or falling prices in the world market, coupled with severe competition both in the international and domestic markets, and lower realisation and heavy burden of interest charges amounting to Rs 26.83 crore contributed to the adverse situation. The ferro alloys industry suffered a blow with the break-up of USSR. Also China's emergence as a ferro alloy exporter further increased competition and dampened prices. Mushrooming growth of small units has resulted in over supply and sharp price cutting. Net sales rose marginally by 0.44 per cent (Rs 1.33 crore) but operating profit fell by 74 per cent (Rs 20.85 crore) and net profit by 106 per cent (Rs 10.21 crore). Depreciation was lower by Rs 2.01 crore, while interest charges rose by Rs 2.54 crore. Other income was down by Rs 5.71 crore, while non-operating surplus rose by Rs 1.18 crore. Exports and imports fell by 20 per cent and 22 per cent, respectively.

Debt-equity ratio fluctuated at 419 per cent in 1991-92, 745 per cent in 1992-93 and 341 per cent in 1993-94. Sundry creditors to current assets rose by 4 percentage points in 1992-93 and then fell by 12 percentage points in 1993-94. Growth in inventories was down by 17 percentage points in 1993-94. Return on investment was up by 3 percentage points in 1992-93 and then fell by the same extent in 1993-94. Net value added to value of production rose steadily by 3 percentage points in 1992-93 and by 2 percentage points in 1993-94. Short-term bank borrowings to inventories fell by 11 per cent in 1992-93 and was 34 per cent for 1993-94.

Exports are looking up with structural changes in CIS countries and economic recovery in Europe and Japan coupled with the increasing level of stainless steel production which is also indicative of likely improvement in prices and volumes of trade in chrome products in future. Power cut, non-availability of suitable raw materials, lack of demand for certain products, transformer trouble, etc., all resulted in shut down of furnaces in 1993-94. During the year the captive power plant at Garividi generated 141.09 million KWH units. The production of charge chrome was lower by 8.8 per cent due to load restrictions and trippings by the Orissa State Electricity Board and lower power generation by company's captive power plant.

Overall production was higher in the steel division. It successfully developed the use

of bottom blown converter for making stainless steels with dolomite refractories. The company expects the cost of production to go down with the stabilisation of the process.

Development of process for production of medium carbon ferro chrome by blending of liquid high carbon ferro chrome and liquid ferro chrome, production of manganese bearing silico chrome, high carbon ferro chrome using 60-70 per cent fine ore, silico chrome using briquettes of coke and use of limestone briquettes made from rejects in ferro manganese operations and use of castable line ladles in low carbon ferro chrome production were some of the areas in which R and D was carried out by the company.

FINOLEX CABLES

Growth of Production

Pune-based Finolex Cables, which is engaged in the manufacture of cables for telecommunications, has registered an increase in net profit by Rs 1.52 crore (5 per cent) and declared a dividend of 55 per cent for 1993-94. Net sales were up by Rs 5.60 crore (2 per cent) and operating profit by Rs 5.51 crore (10 per cent). There was a rise in taxation by 8 per cent (Rs 1.10 crore) and in interest charges by 55 per cent (Rs 4.40 crore), though depreciation was down by 17 per cent (Rs 93 lakh). Other income rose by 8 per cent (Rs 1.11 crore) and non-operating income was up by Rs 3 lakh. Exports have shown a steady rise in the past three years. They rose by 22 per cent in 1993-94.

Inventories fell by 2.79 per cent. Earning per share has shown a steady rise in the past three years from Rs 39 in 1991-92 to Rs 44 in 1992-93 and Rs 46 in 1993-94. Raw materials consumed to value of production fell by 1 percentage point in the past three years. Return on investment rose by 2 percentage points in 1992-93 and fell by 5 percentage points in 1993-94. Net value added to value of production rose from 20 per cent in 1991-92 to 25 per cent in 1992-93 and 29 per cent in 1993-94. Sales to total assets and sales to gross fixed assets have fallen in the past three years. Sundry creditors to current assets fell by 20 percentage points in 1992-93 and then rose by 1 percentage point in 1993-94. Short-term borrowings to inventories rose by 9 percentage points in 1992-93 and fell by the same extent in 1993-94. Gross saving to gross capital formation rose by 33 percentage points. Debt-equity ratio rose by 22 percentage points in 1992-93 and then fell by 2 percentage points in 1993-94.

Production of jelly filled telephone cables went up by over 28 per cent and that of light duty cables and power cables increased about

18 per cent in kilometres and tonnage. During the year the company introduced rubber insulated cables for welding equipment. The increase in output was not reflected fully in turnover due to lower price realisation consequent upon the bearish trend in copper prices during the year since normally the company's prices of cables are linked to copper price levels. To attain better economics, the company shifted its jelly filled telephone cable manufacturing equipment from its Pimpri works to its Urse works. With this the capacity at Urse has been increased to 40 lckm though there will be some gap before the entire capacity becomes fully operational. With the shifting of the jelly filled telephone cable manufacturing equipment to Urse, the modernisation plans at Pimpri are now to be implemented. Negotiations are also in progress for joint ventures for the manufacture of PVC and polycarbonate rigid thermoplastic sheets and PVC calendared products.

Finolex Cables increased its share capital to Rs 18.05 crore from Rs 6.48 crore in 1993-94 by allotting bonus shares and equity shares against GDRs and warrants.

Research and development on light duty and power cables is on to identify new products, improve quality and reduce costs.

SRF

Capacity Expansion

SRF has done well in 1993-94 with net sales increasing by 11 per cent and operating profits by 8 per cent. Taxation fell by Rs 5.50 crore, while depreciation and interest charges were up by Rs 5.01 crore and Rs 1.34 crore, respectively. Other income was up by Rs 2.31 crore and non-operating profit by Rs 2.58 crore. A dividend of 30 per cent was declared for the year against 25 per cent in the previous year. Exports were higher by Rs 32.88 crore.

Raw materials consumed to value of production showed a steady decline from 52 per cent in 1991-92 to 50 per cent in 1992-93 and 47 per cent in 1993-94. Inventories grew by 59 percentage points. Sales to total assets declined by 31 percentage points in 1992-93 and 9 points in 1993-94. Earning per share fluctuated at Rs 15 in 1991-92, Rs 7 in 1992-93 and Rs 11 in 1993-94. Inventories to sales fell from 17 per cent in 1991-92 to 16 per cent in 1992-93 and rose to 23 per cent in 1993-94. Net value added to value of production fluctuated at 22 per cent in 1991-92, 26 per cent in 1992-93 and 25 per cent in 1993-94. Debt-equity ratio fell by 42 percentage points for 1992-93 and rose by 23 percentage points in 1993-94. Short-term bank borrowings to inventories fluctuated at 79 per cent in 1991-92, 102 per cent in 1992-93 and 92

per cent in 1993-94. Sundry creditors to current assets fell by 12 percentage points in 1992-93 and rose by 1 percentage point for 1993-94. Exports to sales rose from 2 per cent in 1991-92 to 7 per cent in 1992-93 to 20 per cent in 1993-94.

Production at the fluorochemicals division recorded a 57 per cent growth while the industrial synthetics and industrial fabrics division operated at 100 per cent of the capacity despite surplus production by the industry. Revenues from nylon tyre cord sales in the domestic market formed only 42 per cent of total sales, thus demonstrating that the company's revenues and profitability were not dependent on any particular segment on business. The expansion of capacities at the Madras and Trichy plants have been completed and so has the construction of ophthalmic houses and chloromethane plants. A plant for processing synthetic industrial yarn into tyre cord fabrics is being set up at an investment of \$ 25 million at UAE. The project is to be implemented by the company's wholly-owned subsidiary. It is to go into production by the third quarter of 1995. The plant is to cater to the demand for tyre cord fabric in west Asia, Africa and Europe. SKF International became a wholly-owned subsidiary of the company in April 1994 with an investment of \$ 50,000 to promote international trade. Trading companies are being set up in Dubai, Mauritius and South Africa.

JAIPRAKASH INDUSTRIES

Lower Margins

The Delhi-based construction and cement giant, Jaiprakash Industries, has registered mixed performance in 1993-94. Though net sales showed improvement by 13 per cent (Rs 66.72 crore), operating profit was up by 5 per cent (Rs 11.73 crore), and net profit marginally by 0.96 per cent (Rs 89 lakh). Taxation was up by Rs 3 lakh, depreciation by Rs 5.22 lakh (15 per cent) and interest charges by Rs 4.45 crore (4 per cent). Other income was down by 32 per cent (Rs 23.10 crore) and non-operating by Rs 1.14 crore. All this had a dampening effect on the margins of the company. A dividend of 20 per cent was declared for the year.

Debt-equity ratio showed a sharp decline in the past three years from 261 per cent in 1991-92 to 183 per cent in 1992-93 and 64 per cent in 1993-94. Short-term bank borrowings to inventories rose by 2 percentage points in 1992-93 and then by 243 percentage points in 1993-94. Sundry creditors to current assets fluctuated at 11 per cent in 1991-92, 8 per cent in 1992-93 and 9 per cent in 1993-94. Sales to total assets fluctuated at 35 per cent in 1991-92, 38 per cent in 1992-93 and 31 per cent in 1993-94. Sales to gross fixed assets rose by 8 percentage

points in 1992-93 and then fell by 5 percentage points in 1993-94. Raw materials consumed to value of production was steady at 3 per cent for the past three years. Return on investment after being steady at 9 per cent during 1991-93 fell by 2 percentage points in 1993-94. Earning per share has been falling from Rs 11 in 1991-92 to Rs 9 in 1992-93 and Rs 5 in 1993-94.

The company completed its construction work at Chamera dam in Himachal Pradesh and the raising of Lakhya earth dam for the Kudremukh Iron Ore Company in Karnataka. The works at other projects, viz, Sardar Sarovar (Narmada Project) in Gujarat, Indira Sagar dam and power house in Madhya Pradesh, Nathpa-Jhakri power house in Himachal Pradesh are progressing as per schedule. The work at the Iraqi Basrah sewerage scheme, in its third stage, remained suspended due to the pending of settlement of outstanding issues. The cement division did well with capacity utilisation increasing by 13.53 per cent. The company, to ensure uninterrupted power supply, has added a 2 x 6 MW DG sets thus increasing captive power generation to 41.4 MW. Jaiprakash's Superplus Jaypee Cement continues to be the market leader in UP and MP, and has now an increased share in Bihar. The Jaypee Bela cement unit with an annual capacity of 1.5 million tonne is under progress. The hotel division's deluxe holiday resort, the Residency Manor, situated in Mussoorie, is nearly complete and a decision on the sale/lease of it is yet to be taken. The international convention centre-cum-hotel at Agra under arrangement with Jaypee Hotels is expected to become operational in early 1996. The implementation of the 300 MW Baspai-II hydro electric power project is in progress. The company has also bagged the contract for the implementation of the 400 MW Vishnu Prayag hydro-electric power project and the 900 MW Kanchan Wangtoo hydro-electric power project. With the objective of concentrating on its hydro-electric projects, the company decided to scrap its plans to set up a 1 million tonne steel project.

RAYMOND WOOLLEN MILLS

New Textile Unit

Raymond, the flagship company of the Vijaypat Singhania group, has done well in 1993-94 after a lean performance in the previous year. The textile division did well, maintaining its market leadership. This division accounts for two-thirds of sales. Demand for the product was high in the market. The Engineers Steel Files Division continued to be the leader in its range of hand tools, in both domestic and export markets. The division's efforts to diversify export markets proved effective. The Thane and Ratnagiri plants of the Files Division earned

the distinction of being the first Indian files manufacturing plant to obtain the ISO-9002. The cement division suffered from sluggish market conditions and also its operations were disrupted during the third quarter by industrial relations problems. These were coupled with frequent power failures and non-availability of wagons.

Net sales were up by 13 per cent (Rs 69.43 crore), operating profits by 11 per cent (Rs 2.99 crore) and net sales by 16 per cent (Rs 6.40 crore). Taxation was up by 27 per cent (Rs 480 crore), other provisions by Rs 10 lakh, depreciation by 22 per cent (Rs 6.80 crore), while interest charges fell by 9 per cent (Rs 2.90 crore). Other income was up by 31 per cent (Rs 2.10 crore), and non-operating profit by 105 per cent (Rs 2.21 crore). Exports were up by 51 per cent for the year; exports to sales ratio has shown a steady rise from 6 per cent in 1991-92 to 9 per cent in 1992-93 and 12 per cent in 1993-94. Debt-equity ratio fluctuated from 79 per cent in 1991-92 to 69 per cent in 1992-93 and 89 per cent in 1993-94. Short-term bank borrowings to inventories rose by 14 percentage points in 1992-93 and fell by 9 percentage points in 1993-94. Sundry creditors to current assets fell by 2 percentage points in 1992-93 and rose by as much as 1993-94. Earning per share fluctuated at Rs 107 in 1991-92, Rs 109 in 1992-93 and Rs 133 in 1993-94. Net value added to value of production fell by 3 percentage points in 1992-93 and rose by 2 percentage points for 1993-94. Growth in inventories fell by 23 percentage points. The company undertook doubling of capacity of the Chhindwara textile unit. A new textile unit incorporating state-of-the-art equipment is being established at a green field site to manufacture initially 5 million metres of high quality worsted suitings. This is to go into operation in 1996. The cost of the project is estimated at Rs 260 crore. Work commenced on the plant to manufacture cold rolled steel strips/sheets and silicon steel sheets with an installed capacity of 1,50,000 MTA at Wadivhar near Nashik. The company has finalised technology transfer agreement with Allegheny Ludlum Corporation, Pittsburgh, USA, the world leaders in manufacturing high quality alloy steel. The plant entailing a capital outlay of Rs 183 crore is expected to be commissioned in the later part of 1995.

R and D work was undertaken in areas relating to the use of exotic fibres, fibre blends and development of new yarns and new fabric finishes. The textile divisions incurred an expenditure of Rs 171 lakh for its R and D activities. The files division developed new products for its exports market and the cement division has installed 'Leitz' Polarised Optical microscope to study clinker morphology and grain structure, which has helped the division achieve better clinkerisation and also improved clinker grindability.

NEW DELHI

Selling Shoddy Goods

B M

Manmohan Singh's budget speech this year was indeed an advertiser's copy – long on rhetoric and short on substance – for shoddy goods wrapped in attractive populist proposals.

THE budget for 1995-96 is a desperate attempt to postpone the day of reckoning in the last year of the tenure of the government headed by Narasimha Rao. Populist-electoral considerations and short-term expediency have been its guiding principles rather than even its own policy commitments. It is not without good reason that even the committed present-day economic 'reformers' are disillusioned with their chosen leader Manmohan Singh, the union finance minister, on whom they had placed great confidence to push ahead with their so-called reform agenda in spite of the grave political set-back for the ruling party in the wake of the resounding electoral reverses. A section of the media has, however, commended Singh for opting for 'wiser marketing techniques' to sell his fifth budget in the Indian market and turning into a 'dream merchant' instead of being a 'technocrat' relying on 'prosaic facts and outlays' to make a reasoned case for his reform policy and programmes.

Singh's budget speech this year was indeed an advertiser's copy, long on rhetoric and short on substance, for the sale of shoddy goods wrapped in attractive populist proposals. He waxed eloquent on the achievements of his budgets for the last four years and related them to criteria in terms merely of recovery from the economy in crisis in 1991. The fact is that the economy is still on slippery ground and the danger of a relapse into crisis even bigger than that in 1991 cannot be ruled out. He has fudged budget figures in the past also; this, however, has become glaring and widely noted in the budget for 1995-96.

Economic growth may have recovered to 5.3 per cent in 1994-95 from less than 1 per cent in 1991-92. But this has come about from already established production capacities in the economic structure. Since investment has admittedly remained subdued during the last four years, the economy has not returned to the growth path on a steady and sustainable basis as was promised would be achieved in a period of three years after the so-called structural adjustment programme. Worse still, fiscal correction has eluded Singh and social services for the mass of the people have visibly deteriorated. Reduction in fiscal deficit was given the

highest priority in the official reform agenda in mid-1991 when the Rao government was formed and embarked on the IMF/World Bank adjustment strategy. There has, however, been sharp slide back in regard to drastic cuts in fiscal and revenue deficits of the government as originally planned and attempted in the first two years of the implementation of the structural adjustment programme. This had its own deflationary consequences for the economy resulting in rising levels of unemployment, poverty and deterioration in social services. Subsequently, fiscal deficit was allowed to go up in 1993-94 as high as 7.3 per cent of GDP as against the target of 4.5 per cent. It has exceeded the target of 6 per cent set for 1994-95 and has, according to the estimate of the finance minister risen to 6.7 per cent but has been actually 7.1 per cent. The rising levels of fiscal deficit have been accepted on the ground that this would give the Rao government some room for manoeuvre in the midst of the turbulent political and social conditions in India that had arisen in 1993. But, side by side, the government had to go quite far on cuts in a wide variety of rates of taxation, direct and indirect, especially customs duties to comfort the middle and upper classes and facilitate the entry of foreign capital, goods and services on preferential terms into the Indian market as part of its globalisation commitments. The assumption, which has fortified by the campaign of the votaries of the economic reforms, both inside the country and from abroad, that investment in private domestic sector and direct foreign investment could be relied upon as the necessary 'safety net' for the economy to function and grow is, however, turning out to be phoney. Totally facile, indeed deceptive, has turned out to be the claim that once responsibility for the development of industry and material infrastructure has been passed from 'inefficient' investment in the public sector to the more 'efficient' private business enterprise, Indian and foreign, economic growth will pick up and financial resources of the government would be released for social welfare such as education, health, agriculture and poverty alleviation. It is no longer possible to 'hide the fact that while

public investment has been drastically cut, private business, domestic and foreign has not stepped it up. Foreign investors, except in a few selected areas where very large investment was not needed, entered into a large number of memoranda of understanding on long gestating projects involving substantial investment to bargain for lucrative terms rather than make investment. The result has been that large lags in infrastructural facilities have appeared and impulses for economic, especially industrial, growth have been crippled. Side by side, social services have suffered gravely. It is not fortuitous, therefore, that inflationary pressures have reasserted and the growth objective has receded.

If the official policy has settled for a fiscal deficit at around 7 per cent of GDP for a long span of time, the more worrying point is the rising levels of revenue deficit, which has doubled over the period of four years of the Rao government. It went up from Rs 33,684 crore in 1993-94 to Rs 39,370 crore in 1994-95 revised estimates which exceed the budget estimate for the year by as much Rs 6,492 crore. The budget estimate of revenue deficit of Rs 35,823 crore is clearly a gross underestimate and is likely to exceed by a large margin. Singh has again resorted to the questionable way of not taking into account losses on account of his giveaways and has blithely assumed that losses of revenue would be covered by better compliance by tax-payers and control of expenditure. These are totally unrealistic assumptions. The fact is that Singh has been unable as well as unwilling to adopt policies and take measures which add up to a credible fiscal consolidation strategy. The revenue deficit has steadily grown and is far more stretched than it was in 1991-92.

The finance minister has been complimented in some quarters for the success of the policy of moderate rates of taxation to raise more revenue for the government, especially in respect of direct taxes which have shown impressive buoyancy in 1994-95. This is to be attributed to the high profits earned by the corporate sector during this year and the one time pickings on account of profits from what is called the 'scam money'. Whether buoyancy in direct tax revenue is a trend and will be sustainable is yet to be seen. But the promise of widening the social base of direct taxes is still to be realised. The landed gentry's claim for total exemption from any direct tax liability is still in force. The professionals are demanding further raising of the direct tax exemption limits on their pays and perks which have gone up dramatically. The scheme for taxing presumed incomes of small traders and those engaged in services and directly on those

with access to a variety of services has really not taken off. The demand for the dilution of the principle of progression in direct taxes by steeply lowering the marginal rate for high income and wealth brackets has, however, become overwhelming with the Chelliah Committee giving it the veneer of economic wisdom. This applies as much to indirect taxes on commodities and services as well so that resources that the government can raise by taxation is tending to be circumscribed and its ability to meet expenditure claims has become severely limited resulting in large revenue and fiscal deficits. The talk by some commentators of a major, even 'historic', shift away from indirect taxes and in favour of direct taxes in the total revenue of the government is indeed premature and an exaggerated view. In spite of the rise of revenue from direct taxes on incomes and wealth in 1994-95 to 40 per cent of total tax revenue, it is not possible yet to assert that this proportion will hold over time or that a trend in this direction has been established. The direct tax net still covers a very small segment of the population and yields only a small part of the national income. Though there is loud talk of the need to reduce high rates of direct taxes to improve tax compliance and widen the social base of taxation, progress in either direction so far is slow and fitful. The seemingly high rates of direct taxes do not take into account the plethora of exemptions for tax payers so that there is wide scope for evasion and avoidance of tax-liability making the effective rates quite low. Additional exemptions have been announced for direct tax payers in the budget for 1995-96.

The budget for 1995-96 is supposed to have as its central thrust reduction in the inflation rate and push forward economic growth with the industrial sector playing the leading role. The cuts in customs duties are supposed to provide cheaper inputs for industrial production and in excise to bring down the prices of industrial goods and boost their sale in the market. These measures are proposed to be combined with releases of foodstocks in the open market and the use of exchange reserves directly to import articles of essential mass consumption which may be in short supply in the market.

These measures may appear to be plausible for attaining price stability as well as promote growth. But doubts are cast on their efficacy, considering the overall macro-economic context in which they have been initiated. The yawning fiscal deficit, the large revenue deficit left uncovered and the relentless expansion in money supply are bound to have a severe inflationary impact. The production facilities have remained static for want of investment, especially investment in the public sector over as long as five years and this will be major constraint on the supply side of the economy. It is a facile idea

that the foodstocks and exchange reserves provide enough cushion to contain the inflationary pressures and ease the supply constraints in selected areas and facilitate the realisation of stability as well as growth objectives.

If agricultural production has not sharply declined in recent years, it is because of good monsoons for seven years in a row. But to let hope overwhelm prudence is not a sound or sensible approach. The endogenous growth potential of the agricultural sector has actually suffered because of declining public and private investment. The situation in this regard has further deteriorated as a result of so-called financial sector reform. The resultant lower availability of institutional credit to agriculture, if combined with drastic cut in subsidies on farm inputs, is bound to affect agricultural growth. The consequences can be disastrous in the event of a bad monsoon year and measures must be initiated to guard against this. The finance minister in making the budget for 1995-96 blissfully ignores this obligation. This only compounds defaults on the part of the union minister of agriculture.

There is much drum-beating about revival of industrial production in 1994-95. The major contribution to the growth of industrial production has, however, come from the automobile sector and consumer durables. That output of consumer durables has grown is of interest to the upper and middle classes but the production of consumer non-durables and essential items of mass consumption – among them, cotton textiles – is still extremely inadequate. Capital goods have shown impressive growth, which is welcome. But this too has come from commercial vehicles, with output of medium and heavy vehicles growing steeply. The sustainability of industrial growth will, however, depend on how broad-based it is and how widespread is the effective demand for industrial products.

The biggest default on the part of the government and a policy direction directly linked to the IMF/World Bank structural adjustment programme is the sharp decline in the government's capital expenditure. It is now proposed to be hardly 21 per cent in 1995-96 of the total government expenditure as against 37 per cent in 1985-90 and 33 per cent in 1992-93. The government has given up its role in industrial development. The idea that this task will be carried out by private enterprise, especially transnational corporations, has been found to be misplaced so far and is likely, in the event of its persistence, to become dangerous not only for the economy but also the polity of India.

The prime minister has been very vociferous in the past on financial allocations of the government for rural development, employment schemes and anti-poverty

programmes as part of his 'middle path' strategy. The finance minister has tried faithfully to go by the prime minister's direction in the making of the budget for 1995-96, the election years. However, he thought it prudent to caution that "we cannot simply spend our way into prosperity". Narasimha Rao, in his first statement after the presentation of the budget loudly claimed that 'benefits' had been spread all around which is what populism in economics and politics is all about. The fact, however, is that the government's financial allocations have been increased from a very low base in 1992-93 and have been made in the context of the overall decline in the rate of increase of development expenditure of the government. They have barely compensated for inflation so that the allocations in real terms have remained stagnant. Though competition in population is gaining ground in all political parties over whatever reform commitments they may flaunt, the entrenched vested interest and the bureaucracy still will not let any radical departure from the established structures and norms for the flow of financial resources that are ostensibly earmarked for poverty alleviation, rural development or social services.

Human resource development, employment and poverty alleviation have hardly received meaningful attention in the budget. While there may be pompous declarations by the prime minister or the finance minister about promoting education and health or poverty alleviation, any significant increase in their share as a proportion of total public expenditure has again been side-stepped. All that has been attempted is a rearrangement in the allocation of always scarce and lately gravely stretched budgetary resources for social services. As for going back to commercial banks for financing anti-poverty and welfare programmes there is something phoney about the government policy of eliminating what is called 'directed' credit as a basic requirement to its financial sector reforms. It may not be misplaced for the votaries of reforms to fear that this would mean more bad loans, more non-performing assets and more budgetary support through intermediation of financial institutions or to suspect that this is all window dressing for the coming elections to the Lok Sabha and ways would be found for the bureaucratic 'processing' of the budget proposals in the time-honoured leisurely fashion so as to ensure that none of these proposals are really implemented except to arrange benefits selectively for a few till the elections are over. After all, the setting up of the National Minorities Development and Financing Corporation was announced by the prime minister on independence day, 1993 and Manmohan Singh in budget speech for 1995-96 declared that it would enjoy from next year exemption from income tax.

Tax Reform on Hold?

The 1995-96 budget proposals fail to advance the objective of moving towards a simpler, fairer and less distortionary tax system that the finance minister professes to pursue.

DESPITE all the 'brave talk of better compliance making up for the likely revenue cost of tax concessions and distrust of conventional methods of calculating the revenue impact of budget changes, the finance minister has, very wisely, not gone along with Lafferites who would like to have the maximum rates of income tax, both personal and corporate, brought down to 30 per cent if not lower. The fact of the matter is that, after slashing the customs and excise tariffs on a wide front, the finance minister simply could not afford to take further risk with his revenue. But there are sops to keep the taxpayer happy. First, the rise in the exemption limit for personal income tax and the relief under section 80I, and then the specification of laudable charities and investments that will earn 100 per cent deduction from taxable income. Not that the list is very long nor are they unknown to Indian income tax. Only, they sound somewhat discordant against the philosophy that was put forward as the cornerstone of the reforms on the tax front which were initiated three years ago.

A basic tenet that has guided our tax reforms, as those of many other countries in recent years, has been 'widen the base, reduce the rates'. The aims of equity, efficiency and simplicity are served best, it is argued, when the base of the tax is comprehensive, be it income or consumption. For that levels the playing field and makes for simplicity by avoiding the pitfalls and consequent complexities of the law that invariably accompany preferential dispensation for selected sources or uses of income or, when the base happens to be consumption, for particular commodities and services in the consumption basket. A wide base also lends buoyancy to revenues at rates that go down better with the public. The conceptual framework underlying the recommendations of the Chelliah Committee was also anchored avowedly in the doctrine of 'wider base and lower rates'.

Unlike in countries where similar reform has taken place, however, base widening has not been pursued by our government with the same conviction as cutting the rates. While some of the hefty ones among the incentive provisions in the Income Tax Act have been done away with, a good many still remain on the statute book and quite a few new ones have streamed in even after the

proclamation of the reforms. Witness, for instance, sections 35AC, 35CC, 35CCB, 80D, 80G, 80GGA, 80HBB, 80HHC, 80HHE, 80JJ, 80L, 80O, 80P, 80Q, 80QQA, 80R, 80RR, 80RRA and 88, not to mention the odd package wrapped in section 10 with some 30 subsections. A few of these, no doubt, serve to refine the measure of taxable income by allowing for the costs of earning but many go well beyond what income accounting *per se* would call for. As is well known, tax incentives are a wasteful and inefficient instrument for promoting social or economic goals and once in they are difficult to expurgate. That is why expert opinion disapproves of the use of the tax laws for non-tax purposes. This year's budget proposals in the area of direct taxes do not quite advance the aim of moving towards a simpler, fairer and less distortionary tax system that the finance minister professes to pursue.

True, many of the reform measures were taken in the initial years and there is a notable step in this year's budget to help better enforcement, viz. the proposal to extend the requirement of TDS to several new income payments (One hopes the finance minister will not succumb to the powerful pressure to withdraw the proposal.) Yet, quite a few of the significant recommendations of the Chelliah Committee still remain ignored and the spirit underlying the reforms seems missing in this budget. For instance, the budget proposes to exclude any but the small industries from the benefit of tax holiday for operating from backward areas but the impact of this abridgement of the tax holiday, which in any case has no place in the new philosophy, gets undermined when in the same breath the finance minister proposes its extension to new sectors. While infrastructure is unquestionably a priority area, is tax remission a cost effective way to attract private investment in roads and ports? Insofar as they are meant to attract foreign investors, the benefit would go probably to the exchequer in their home countries. Besides, once the tax system is allowed to be used to favour a particular sector, pressures invariably build up from others for similar treatment. That lesson does not seem to have been taken seriously by our policy-makers. It would have been more consistent with the scheme of reforms and perhaps liked more by the business if

the tax rates were reduced while going further along towards a truly comprehensive base by removing the existing incentives and bringing under taxation all ingredients of economic power like fringe benefits of employees in all sectors, public and private, as recommended by the Chelliah Committee. If savings are to be promoted, the right course would have been to follow the Chelliah Committee's prescription to link tax benefit to net saving made in a year, rather than to the amounts put in the eligible instruments, irrespective of withdrawals.

Base widening in terms of getting a larger proportion of the population in the tax net also suffers when the threshold for personal income tax is raised from Rs 35,000 to Rs 40,000. Perhaps a million taxpayers would go out of the net simply because of this. If allowance is made for the price rise that has taken place in the last one year the revision of the exemption limit does not seem to be unreasonable, although it can be readily seen that the rise goes beyond what is required for indexation. Besides, as the finance minister himself noted in his budget speech, together with the other deductions available the level at which incomes truly become taxable is as high as Rs 68,000. This is more than seven times the estimated per capita income in India for the coming year, an unusually high threshold even by poor country standards. Whether better administration can make up for the concessions and the income taxes can maintain their present revenue buoyancy despite these dents will no doubt be the ultimate test of how sound the strategy has been.

In indirect taxes reforms seem to be going ahead. It must be acknowledged that the customs and excise structure look very much simpler and rational than before. But moves toward a wider, rational tax structure still falter. The promise of lowering the customs tariff has been faithfully fulfilled and some of the irritants in the application of MODVAT have been removed. But rate cutting has not been matched by base widening to the same extent. Services by and large remain outside the tax net. The finance minister has chosen to ignore the likely revenue loss of about Rs 1,500 crore, again by casting doubt on the soundness of the conventional calculations in this regard. One hopes he proves right. Even if he does, the revenue would need to grow at a much faster rate than postulated in the budget if the ground lost in the first three years of reform is to be retrieved.

Granting that lowering of customs tariff is an integral part of structural adjustment programmes seeking liberalisation, the standard prescription for the exchequer to make up for the fall in revenue that results is to turn more to taxes on domestic income

and consumption. Since taxation of incomes cannot possibly be that productive of revenue in a developing country attention has focused more on devising a system of taxing domestic trade that fetches the required revenues without being needlessly distortionary. It is in this context that the value added tax has figured so prominently in the reform agenda of all countries going through structural adjustment of their economies.

It is pertinent to point out that even with the surge in direct taxes the ratio of the centre's gross tax revenue to GDP remains at about 9.8 per cent, down by nearly 1.5 percentage points compared with the pre-reform level. The decline that came with the drop in revenue from indirect taxes is yet to be made up. Direct taxes have helped to recover the lost ground only by 0.6 percentage points. There is no way this can be made

up without an all-embracing tax on consumption comprising both goods and services like the VAT.

Recognition of the urgent need to move towards a system of value added tax was reflected in the previous budgets. A committee of state finance ministers was formed last year to work out an acceptable model of VAT at the state level. While action to this end lies primarily with the states, the centre too has an important role to play, especially in overseeing that the reforms in this important area get moving and in the right direction. Surprisingly, the budget makes no reference to what is happening on that front. Like the unfinished tasks on the direct taxes side, one wonders if the moves towards a truly rational regime of domestic trade taxes have also been put on hold. Or have the reforms no further to go?

made to diversify the production pattern and grow a variety of plantation and horticultural crops in Tripura mainly on hillslopes which are unsuitable for the production of plainland rice. There is only one medium-size industry in the state, i.e., the Tripura Jute Mills (TJML) and there are about 1,400 permanently registered small-scale industrial units. Cottage industries and traditional home-based production provide additional employment and income to large sections of the rural population of the state. The government is the biggest employer in the organised sector but most of the employment generated by the government is in the tertiary sector and is of an unproductive kind. The state suffers from a lack of infrastructural facilities. Its road, air and railway links with the rest of the Indian subcontinent as well as banking and insurance facilities are badly in need of expansion and are extremely poorly developed. Despite reserves of natural gas in the state Tripura is a net importer of electricity and suffers from a chronic power shortage. It is dependent on the rest of India for the supply of basic inputs, finished products and food and does not send many products outside the state, its main exports to the rest of India being primary products like timber, bamboo, etc. The state has a low level of per capita net SDP and a high incidence of poverty and unemployment. Though compared to the all-India figures, the state has a reasonably high literacy rate, trained and skilled manpower is in short-supply in Tripura. Health care facilities are not adequately developed and basic needs of the people like safe drinking water are not adequately met. Tables 1 through 7 give some quantitative data regarding the state to illustrate the points that have been made in this section.

The state needs to create employment opportunity for its people without compromising productivity for improving the standard of living of the vast majority

TRIPURA

Illusory Gains of Liberalisation

Malabika Das Gupta

What has been the impact of external sector liberalisation on the small backward state of Tripura? The hope that the state would be able to increase its exports of primary products has not materialised.

SINCE the beginning of the 1980s and particularly since 1991 India has embarked on a policy of liberalisation of its external economy giving incentives to boost exports and removing restrictions on exports, reducing tariff rates and eliminating quantitative restrictions on imports opting for full convertibility of the rupee on the trading account and encouraging foreign investment and technology transfers.

What has been the impact of external liberalisation on a small backward state in the north-east Tripura? Quite a lot has been written on the impact of external liberalisation on the Indian economy as a whole but to the best of any knowledge, studies relating to the impact of external liberalisation on the economy of individual states especially of states situated in north-east India are conspicuous by their absence.

Tripura is a small land-locked state in north-east India which has a 839 km long border with Bangladesh. Roughly two-thirds of the total area of the state is hilly so that there is a shortage of land suitable for growing foodcrops like plainland rice. 39 per cent of the total land mass of the state has been declared as 'reserved forests' and cannot therefore be used for other developmental purposes. The demographic picture of the state reflects the uninterrupted influx from across the border that has radically altered the demographic balance.

The state tribals who now form a minority of the population of the state still practise 'jheeming' or shifting cultivation to a large extent and are more backward than the non-tribal segment of population. The vast majority of the workers of Tripura continue to be employed in the primary sector and the unorganised sector absorbs most of its labour force. Low-productivity agriculture, mainly of the rainfed type, for the production of paddy on small and marginal holdings is the main source of employment in the economy although attempts are being

TABLE 1: LAND USE PATTERN IN TRIPURA AND INDIA

(in thousand hectares)

	Tripura (1989-90)	India (1986-87)
(1) Not available for cultivation		
(a) Forests	606.168 (57.78)	67,094 (22)
(b) Area under non-agricultural use	132.300 (12.61)	41,476 (13.6)
	738.468 (70.39)	108,570 (35.3)
(2) Other uncultivated land excluding fallow land		
(a) Pastures and other grazing land	0 (0.0)	11,894 (3.9)
(b) Other miscellaneous tree crops not included in net sown area	38.084 (3.63)	3,355 (1.1)
	38.084 (3.63)	15,249 (5.0)

(4) Current fallow	13,047 (1.24)	15,249 (5.0)
(5) Fallow other than current fallow	0.800 (0.08)	10,064 (3.3)
(6) Net sown area	258.00 (24.59)	1,40,590 (46.1)
Total	1049.169 (100)	3,04,971 (100)

Note: Figures within brackets indicate percentage of total area.

of its people. What are the prospects of development of a backward state like Tripura in the context of external liberalisation and what advantages can it hope to reap from the process?

The 'Asian Tigers' have achieved a spectacular growth based on the export of labour-intensive manufactured goods. In Tripura their example is quoted often to show what rich benefit can be reaped on a small scale from the policy of external liberalisation without bothering to examine if the conditions are the same. South Korea and Taiwan created a mass-based economy before they went in for liberalisation. These countries received a significant amount of foreign aid for their development. Their export industries got considerable assistance from the government and three countries of this group at one stage or the other had depended on import-substituting industrialisation for their development and had protected their industries from foreign competition.

If liberalisation of the internal sector is to increase the flow of foreign direct investment and technology into Tripura and also boost its exports to the rest of the world the infrastructural facilities of the state will have to be improved and investment made in improving the quality of resources available. The centre will have to play an effective role as a facilitator and remove the bottlenecks that stand in the way of effective external liberalisation. It will also have to reduce the social costs associated with external liberalisation. Again, for the growth of exports and inflow of investible funds from abroad international liberalisation will be required. Even if we make the heroic assumption that all the conditions will somehow be met, external liberalisation is not going to provide an answer to Tripura's problems.

As things stand at present Tripura is very unlikely to get investible funds from abroad or foreign technology as a result of the external liberalisation policies being followed in India. With the large incidence of poverty and unemployment in the state, the market in Tripura for luxury items likely to be produced with foreign direct investment or in joint ventures is going to be limited. Then again the lack of power infrastructural facilities like transport and banking, sufficient quantities and assured supplies of good quality raw materials, the difficulty of getting skilled manpower and other such bottlenecks are unlikely to make Tripura foreign investor's haven. The lack of transport and communication facilities with the rest of India would make goods produced in Tripura with foreign direct investment, foreign collaboration or by MNCs difficult to sell at competitive rates in the rest of India and difficult to export to foreign countries other than probably

Bangladesh. Unfortunately, the geopolitical realities of the region will not make it possible for foreign firms producing in Tripura to have access to the Bangladesh markets. Some

Indian companies reported to be negotiating with the Bangladesh government to produce goods there for sale in the eastern region and also in Tripura, taking advantage of the low

labour cost in the neighbouring country. Even if foreign investment does take place in Tripura despite these heavy odds, it is unlikely to be invested in high-priority infrastructural sector like transport and communication or in the production of goods and services needed to meet the basic needs of the majority of the people of the state who live below the poverty line. Foreign investment is not likely to lead to local raw material-based industrialisation with well-developed forward and backward linkages with other productive sectors in the economy because of inadequate returns from such investments from their point of view. Gas-based industrialisation is another area where foreign capital may not be forthcoming in Tripura in view of the problem of extremism in the state and uncertainties and delays in the supply of gas. Foreign investment in the agricultural and forestry sector including plantations if it does take place, will pay scant heed to the nutritional needs of the people or the ecology of the state as it will be guided by the profit motive and not by any social considerations.

However, Tripura in going to bear the brunt of whatever foreign investment takes place in India as a result of liberalisation savings will be reduced due to the consumption of ostentatious and expensive goods produced by foreign investors for upper class consumers in Tripura who have access to these goods produced by multinationals and joint venture firms in the rest of India. Products produced with foreign capital or foreign collaboration like soft drinks, potato chips, etc. are already flooding the consumption goods market in Tripura sounding a death knell for the small-scale producers of these products in the state and aggravating its acute unemployment problem. Bank branches in Tripura which were unprofitable are being closed down as a part of the national policy of phasing out nationalised banks on the plea of improving the efficiency of the service sector while the actual motive seems to be to allow foreign banks to gain a foothold in the country. The vacuum created by the winding up of bank branches will not be filled up by foreign bank branches in Tripura because business will not be large enough to make their operations profitable.

Though theoretically, Tripura should be able to increase her exports of primary products like timber, agro-based products, handlooms and handicrafts or at least increase the volume of exports taking place legally because of concessions given to exporters, this has hardly been the case in actual practice. A variety of factors are responsible for this including trade barriers imposed by Bangladesh on the entry of Indian products into the country. Liberalised exports from India will not boost exports from Tripura to Bangladesh because the two economies

are not complementary. Many of the goods of Indian origin which find their way into Bangladesh market from Tripura are not produced in Tripura but in other parts of the country.

Exports from Tripura of products produced in the state are hamstrung by a variety of problems. These are problems relating to the lack of transport and infrastructural facilities, procurement of plant and machinery for export production problems of entrepreneurship, lack of skilled manpower and knowledge about the new export procedures, incentives offered to exporters under the government's policy of liberalisation, credit facilities, packaging, market research, quality control and so on. There is no foreign trade office in Agartala making the marketing of products difficult in the export market. The Tripura Handicrafts and Handloom Development Corporation (THHDC) is recognised by the government of India's Export Promotion Council but it has not tried to bag any export orders because of such constraints. True some Bangladesh entrepreneurs have expressed an interest in importing fruit juice, air-conditioning equipment and after machinery from distributors of these products located in Agartala are provided by well known Indian firms but the problems cited above have prevented them from placing orders for agro-based products produced in Tripura. Even before liberalisation, the markets for these products in the rest of the world was very uncertain as in the case of pineapple concentrate produced in Tripura which was marketed in the erstwhile USSR by an export agency based in Calcutta. At present then, liberalisation of exports has not done anything to boost Tripura export of manufactured products and is not likely to work wonders in the near future either.

Agricultural products like rice, fruits and Tripura's timber wealth find their way into the Bangladesh market through smuggling but this trade is not becoming legal as a result of liberalisation probably because smuggling is a low-risk, high-return operation in Tripura. The export of raw materials is in any case not to be encouraged because adding to the value of the product through further processing at home is desirable as it leads to the development of the economy through forward and backward linkages. Besides, export promotion at the cost of depriving the poor people or deterioration is not to be encouraged. Even if export-based agro units could be established in Tripura using agro products, these would in all probability be home-based units depending on the putting out system, which would exploit the labourers employed and not do much to improve their levels of living.

That Tripura has not gained much from export liberalisation is evident but at the

same time, the state has had to pay a heavy price for export liberalisation in India. The price of many goods of common consumption in Tripura has gone up because in order to meet the foreign demand for these products domestic supplies have been curtailed. Technology transfer has raised the price of many other goods produced in India which are brought by consumers in Tripura, pricing them out of the reach of many poor consumers in the state.

The only way in which liberalisation has seemed to help Tripura is that the state has been sanctioned Rs 3,500 lakh out of the World Bank loan. The loan has been sanctioned to Tripura to finance externally-aided projects fund during the year. Departments like agriculture, horticulture, power and public work have been requested by the planning and co-ordination department of the state to prepare detailed project exports for onward transmission to the World Bank. However, presumably because expertise is lacking for the preparation of projects costing more than a crore of rupees and because loans will have to be repaid and serviced and the mega projects managed efficiently, departments have been reluctant to submit proposals. All things said and done, the gains from external sector liberalisation can be said to be illusory, for Tripura will not succeed in making the state prosperous and free from the curse of poverty and unemployment. Restructuring the Indian economy so that it achieves growth with equity and balanced regional development will be required if Tripura is to gain.

Blue Revolution in a Green Belt

M Naganathan
K Jothilal Sivaganesan
C Rajendran

The fisherfolk and peasants of coastal Tamil Nadu are organising themselves against the encroachment of prawn farming which is adversely affecting the environment and their life chances.

NAGAIQand-E-Millet District (NQM), a district recently bifurcated from Thanjavur, the so-called 'granary' of Tamil Nadu, and Karaikal, belonging to the union territory of Pondicherry, are now witnessing the mushroom growth of prawn (shrimp) farming in the name of 'Blue Revolution'. The phenomenon is causing severe damage to the eco-system of the region, loss of fertile paddy fields, unemployment of farm labourers (mostly the dalits), and alienation of fisherfolk from their common resource base. The resultant people's movement organised by environmentalists, peasants and fisherfolk is getting intensified and by all probability they will not settle down for anything less than a clear-cut government policy on aquaculture in which the prevention of environmental degradation and the rights of peasants and fisherfolk to survive in their region are assured. People of this region, especially peasants and fisherfolk, have demonstrated that their collective will-power and continuous agitation, could be effectively used to establish their rights to survival and prevent the environmental degradation inflicted by the reform-guided, export-oriented, foreign-exchange mongers.

During the initial period of the reform, the corporate giants like ITC, SPIC and MAC industries found Chidambaram district suitable to promote white shrimps (*penaeus indicus*) which fetch a lucrative price in the international market. Chidambaram was selected because of the availability of brackish water with high salinity which is conducive for the growth of white shrimps. However, later a dramatic shift took place in the calculations of the corporate giants.

Another prawn species that has been found suitable in Tamil Nadu is tiger shrimp (*penaeus monodon*). This variety prefers water with low salinity, and mostly, the estuaries where the entry of the fresh river water reduces the saline level of the sea water meet this condition. The coastal areas of NQM district perfectly satisfy this condition since the main tributaries of Cauvery and her innumerable irrigation canals pass through this region. Moreover, the availability of fresh water resources can be used to maintain saline level exactly at a prescribed level. The tiger shrimp is the

largest among the marine prawns with a growth of about 32 cms. It is a fast growing variety which grows about 10 cm in three months and 22 cm in an year, with an average weight of 95 gms. Above all, the changed taste of foreign consumers in favour of this variety prompted our corporate giants to accumulate quick foreign exchange. Thousands of acres of rich fertile paddy fields were acquired by paying tempting prices.¹ Land ceiling regulations were discarded. False promises like employment opportunities and provision of various infrastructural facilities were offered. The Delhi-based, Mani Shankar Iyer, an MP of Mayiladuthurai constituency, suddenly surfaced to promise that the region will be converted into another 'Dubai' through this 'blue revolution'. Thus, the patronage of the union and state governments, MPEDA,² the political leaders and their benamies have laid the foundation for the blue revolution.

Out of the 1,000 km coastline of Tamil Nadu, NQM and Karaikal cover a length of 110 km. This area is rich in alluvial deposits of Cauvery. The rich groundwater sources in addition to the canal irrigation facilities and the catchment area formed by the estuaries, are the other resource bases. It is needless to say that farming and fishing are the main occupations of this area. However, when 15,000 acres of cultivable lands have been acquired and encroached upon for shrimp farming by 10 major companies and about 150 medium and small ones, alienation of fertile lands from the peasants and loss of access and control over the existing common resources like sea, canals, groundwater, common lands, etc., has resulted.

Let us take the specific case of Pudukkuppam, a fishermen hamlet on Cauvery. The village has 175 households, mostly engaged in fishing. During the off-season, the Neythavaasal canal from Cauvery, adjacent to their village, is the only source of survival. Shriram Marine Harvest Limited has initiated its 'intensive shrimp farming' in 300 acres near the village and has harvested two yields of shrimps. The company later extended its area to another 700 acres, and in the process, more than 25 acres of paddy lands have been cornered

up and 300 trees have been uprooted. Ponds were constructed and a pumping station was installed with two giant motors to pump the sea water into the ponds. Three canals were also constructed to drain the sewage, one of which mixes with the Neythavaasal irrigation canal. Two more firms, Prawnex Sea Food and Krishna Farm, have also started the same exercise in 460 acres of land around the same village.

Coming to the social, economic and ecological implications, the large pipeline with powerful motors has damaged the fishing nets of Kattamarans. In the first three months, the Kattamaran owners incurred a loss of Rs 13,500. Death of eight persons of different age groups due to various unknown diseases have been reported within a period of two months. Around 100 persons have reported to have eye irritation since the operations of the firm. Shenbagam, a local fisherman, had a narrow escape from being sucked by the water pump when he tried to save his net from getting damaged by the suction pumps. Women of this area report that the groundwater has become saline and now they have to walk a distance of 1.5 kms to fetch good drinking water. The fish vendors/head-loaders (mostly fisherwomen) have been restricted from using the traditional pathway along the coastal line and now they have to walk an extra seven kms to reach the market. There are also reports about women being harassed by men working in the prawn farm. Some of the families are earning their livelihood by collecting the floats in the coast. The firms are suspicious on these pickers and recently, one of the villagers was beaten up and threatened not to use the coastal line for similar purposes. False complaints have been lodged against the villagers under various crimes.⁴ There are also frequent incidences where women head-loaders slip into the sewage canal while crossing them and incur, besides physical injuries, material loss. There are other problems too. The villagers are losing their access to fuel and fodder and drying yards for drying fish nets. There is also a loss of fish catch due to influx of untreated toxic chemical effluents into the sea.

The problems of the peasant villages are slightly different. Normally, ponds are constructed in 2.5 acres of land with six feet depth. They are filled with two feet of brackish sand and later by sea water. About 25-30 per cent of the seawater is to be replaced daily. Depending on the ammonia content and other parameters, the replacement may go up to 80 per cent. Moreover, along with the application of organic chemicals, oxygen is dissolved into the ponds using aerators. Adding oxygen to the existing hydrogen sulphide results in sulphuric acid. This blackens the soil, making it infertile. Further, the seepage of the brackish water

with chemical effluents into the neighbouring lands makes them totally unfit for cultivation. The dumping of unhygienic waste in the open results in pollution of air and water bodies and series of chronic health problems arise. Loss of grazing field for the cattle is another irritant for the already unemployed farm labourers.³

The first full-fledged people's protest against the shrimp farming was a huge procession at Mayiladuthurai on January 28, 1994. Later on, Uzhaikkum Vivasayigal Iyyakkam (Working Peasants Movement) convened a meeting at Ozhugaimangalam to discuss the future course of action. The meeting was attended by the village representatives, men and women of 140 villages of Thanjavur and Nagapattinam districts. In the next few days a study team of Tamil Nadu Environmental Council visited the village at the request of Social Need, Education and Human Awareness (SNEHA) and brought media attention. This forced the prawn companies to form their own association to resist the struggle. They also submitted a memorandum to Jayakumar, the minister for fisheries, to allot poramboke lands for the extension of their farmings and to grant clearance for their ongoing projects from the Pollution Control Board. Regarding the people's agitation, they argued that it is possible to recycle the waste with proper management. Brackish water seepage into the paddy field and discharge of untreated effluent into the water bodies would also be taken care of. Moreover, the aquaculture industry will promote several ancillary industries and provide more employment potential for the rural population. They also argued that only fallow lands were being used and not cultivable lands for aquaculture. However, the villagers are not prepared to buy these fabulous stories. Since the government turned a deaf ear to their grievances, they have initiated direct action.

On April 5, when the bulldozers of Magna Foods and Protein started removing all the huts in the settlement area of Nayakkarkuppam, the proposed site for prawn farming, local people gathered in large numbers and opposed them. The consequent visit of the district collector and the commissioner of fisheries stopped the operation to diffuse tension. After this, on July 24, 1994 people from Keezhamonarkarai stopped the functioning of a Coimbatore-based company. On the next day, fisherfolk and peasants of Pudukkuppam prevented the Shriram Marine Harvest from digging the fourth sewage canal. On August 4, men and women from Chinnorpettai and Mandaputhoor prevented the DCM and Shriram Aqua Foods from destroying trees and sent back five lorries loaded with sand. Now their demand is that both, the ongoing and future construction of aquaculture farms,

should be stopped immediately. If the government remains indifferent to their demands, the entire community will launch a continuous struggle to secure their fundamental rights.

When the struggle got intensified, violence erupted on August 10, at Thennampattinam in Sirkali taluka. Fourteen houses were demolished and 34 huts set ablaze. Many incurred severe injuries. The police denied us permission to visit the village. According to PUCL fact-finding team's report (they have also been denied permission), "34 houses of dalit families active in the agitation against prawn farms have been burnt down by the goondas hired by the company with the open support of the police... this attack on this village is pre-planned to suppress the movement and agitation against the prawn farms". The version of the local police is that the agitation became violent and that the agitationists themselves set fire to their own houses, attacked the supporters of prawn farms and police.

Though the Tamil Nadu government, even the union government for that matter, has no clear-cut policy on aquaculture, it responded at last. Jayakumar, the minister of fisheries, announced that the government has taken into consideration the effects of prawn farms. An expert committee will be constituted and necessary enactments will be made to prevent the damages, he added. Not satisfied with the government responses, the PUCL met the chairman of the National Human Rights Commission at Madras and briefed the problems. The latter asked Sudha Ramalingam, the general secretary of PUCL, Tamil Nadu, to submit a detailed report in this connection on August 23 in New Delhi. Accordingly, a delegation comprised of Jesu Rethinam of PUCL, P Christy of Nagai-Karai District Fisher People's Forum, Antonysam, convenor of the Tamil Nadu environmental council, Chandramohan of the Working Peasants Movement and John of the Delhi Forum met the chairman. They have also submitted a memorandum to the ministry of environment, urging the appointment of a committee to make an environment impact assessment of shrimp farms. Till then all

the activities should be stopped and no new units be allowed to come up, the PUCL demanded.

Notes

[The report is based on our personal visit and information provided by Jesu Rethinam, Christy and K. Shanmugham].

- 1 The companies acquired the lands through treacherous and insidious methods. When we asked, having understood all these problems why did you sold your lands?, a villager replied that "they have offered so many promises - construction of temple, school, roads, hospital, employment opportunities in prawn farms, etc. The prices offered were also more attractive. At that time we had not realised that we are going to lose agricultural work for ever". Gunasekaran, an organiser CPI(M) added, "When we realised, we stopped selling our lands. But the big landlords, mostly the brahmins, profited from this scarce situation by selling at a large scale unimaginary prices."
- 2 The Marine Products Export Development Authority (MPEDA) within the ministry of commerce has taken the lead in the promotion of intensive monoculture in this region and it has also opened its branch in Thanjavur to extend all financial assistance, research and training facilities to the holy cause of earning foreign exchange.
- 3 The traditional rice-shrimp rotating polyculture has proven to be sustainable because this low-input extensive system avoids using processed seeds, chemicals and antibiotics. Now the traditional system has been replaced by more intensive methods of monoculture which could produce thousands of kilograms of shrimp per crop. In the case of the former it is only 100-240 kg.
- 4 The erstwhile Indian People's Front (IPF) functionary, Gunasekaran, is the first victim on whom the police filed a case on charges of possessing explosives and bombs to use against Shriram Company. The IPF initiated the struggle against the company two years ago.
- 5 During the initial stages like constructing ponds, etc, the villagers agreed that they got employment almost daily. When such work got completed, they realised that they have lost their employment in paddy fields for

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Sorry State of UP's Economy

Kripa Shankar

With declining investment and profligate non-developmental expenditure, Uttar Pradesh's economy is in the doldrums.

OF all the 14 major states of the Indian Union, UP has the lowest human development index (HDI) of 0.07 of as against 0.11 for Bihar, 0.14 for MP, 0.19 for Rajasthan and 0.21 for Orissa, the national average being 0.37. Although Bihar and MP have a lower per capita state domestic product, they stand above UP because of higher life expectancy and literacy percentage being higher in MP. Orissa has almost the same per capita domestic product as UP, but stands above in life expectancy as well as literacy rates and consequently has a higher HDI of 0.21. Similarly because of higher life expectancy, Rajasthan stands above UP despite a lower literacy rate (*Annual Plan UP, 1994-95, Vol 1, p 59*). UP has the highest infant mortality rate in the country and has the largest concentration of people living below the poverty line which is increasing in absolute terms despite a decline in percentage terms. According to the state annual plan 1994-95 the absolute number of people below the poverty line increased from 506 lakh in 1977-78 to 530.6 lakh in 1983-84 and further to 599.63 lakh in 1987-88 (pp 71-72). Households in the rural areas with an annual income of less than Rs 8,387 and Rs 9,164 in urban areas were found to be living below the poverty line in 1987-88 in UP. The cost of living index number for agricultural labourers increased from 650 in 1987-88 (base 1960-61 = 100) to 1,285 in December 1994 or it has doubled since then while agricultural production has stagnated and per capita annual foodgrains production in the state has declined from 273 kg in 1988-89 to 261 kg in 1990-91 according to official estimates. In subsequent years it has further declined. All this must have aggravated the problem of poverty.

The deceleration in growth rate of agricultural production in the state is the most disconcerting factor as it is the mainstay of the economy and supports three-fourths of the population. Foodgrains production in the state has been hovering round 355 lakh tonnes for the last few years while population continues to rise at an annual rate of 2.5 per cent. Yield per hectare of various agricultural crops is now stagnating which in the past had been principally responsible for rise in production.

A drastic stepping up of both public and private investment in the agricultural sector is required if a breakthrough is to be made. Public sector investment has induced private investment in the past and therefore, the

beginning has to be made with public investment although the question of raising the efficiency of investment hitherto made in this sector particularly in irrigation and power is no less important. Yield of foodgrains per hectare in UP is 18 quintals as against 35 quintals in Punjab. The soil rating of UP is higher than that of Punjab and rainfall is also almost twice. Whereas Punjab has made better use of its water resources, UP has failed in this respect. More than 92 per cent of the cultivated area in Punjab is irrigated as against 57 per cent in UP. The annual loss on state irrigation works in UP is more than Rs 700 crore which is rising every year while the area irrigated by state irrigation works is stagnating. Per hectare consumption of fertilisers in Punjab at 156 kg is significantly higher than that of UP at 86 kg but per hectare credit from co-operative credit societies is also twice in Punjab.

In the industrial sector UP's backwardness is equally pronounced. Industrial investment per person in UP at Rs 1,082 is lowest among all the major states excepting Bihar. In Gujarat, Maharashtra and Punjab it is three times that of UP. The average daily number of workers in registered working factories per lakh of population in UP at 454 is the lowest except in Bihar and MP. In Maharashtra it is four times that of UP. Per capita production of electricity in UP is also only 40 per cent of the national average. All this is reflected in the per capita income which is lowest in UP excepting Bihar. Excepting Bihar, other BIMARU states appear to be moving faster than UP. Rajasthan which used to have a lower per capita income has now left UP behind and MP has already

a higher per capita income. The gap between the per capita national income and that of UP is widening with every passing year. The latter at Rs 4,012 in 1991-92 is now less than three-fourths of the former at Rs 5,529.

The main reason for the poor performance of UP has been the (i) inability of the state to generate enough resources to step up investments; (ii) inability to use productively the resources by checking, as far as possible, non-developmental expenditure; (iii) inability to make efficient use of the investment made; and (iv) reliance on borrowings to finance the expenditure. We will briefly dwell on these issues.

Per capita state tax revenue in UP is lowest among all the major states excepting Bihar. A poor state like Orissa has higher per capita tax revenue. The same in MP and Rajasthan was Rs 343 and Rs 377 respectively in 1992-93 as against Rs 256 in UP. The national average was nearly twice at Rs 460. The picture for some of the states is shown in Table 1.

Apart from tax revenue, as regards non-tax revenue also UP lags behind the major states excepting Tamil Nadu and Kerala. But UP is not so unfavourably placed as regards share in central taxes as UP's share at Rs 205 is only marginally lower than the national average at Rs 213.

CENTRAL ASSISTANCE

Much has been made about the lower central assistance to UP as a factor in UP's backwardness but it will be seen that central assistance on per capita basis was Rs 172 in Punjab, Rs 138 in Haryana, Rs 111 and Rs 116 in Maharashtra and Tamil Nadu respectively as against Rs 152 in UP. Kerala which has the highest quality of life index had an assistance of Rs 166 in that year, only marginally higher than that of UP.

It has been argued that as UP is poor its per capita tax revenue is also lower. But the fact should not be lost sight of that other backward states along with developed states are making greater efforts in this connection

TABLE 1: PER CAPITA REVENUE RECEIPTS IN 1992-93

(in Rs)

State	Sales Tax Revenue	State Non-Tax Revenue	Share in Central Taxes	Central Assistance	Total Revenue
Bihar	175	123	230	138	665
MP	343	213	195	183	934
Rajasthan	377	187	205	240	1008
Orissa	274	100	265	301	940
UP	256	89	205	152	702

All India	460	146	213	200	1019

Source: Uttar Pradesh Aya Vyak ki Rooprekha, pp 73-74.

which will be clear if we compare the per capita tax revenue as a percentage of per capita income in the various states. In 1991 the per capita tax revenue as a percentage of per capita income was lowest in UP except Bihar and Assam (the latter is passing through disturbed conditions). The same was 6.66 per cent in UP as compared to 12 per cent in Tamil Nadu, 11 per cent in Kerala and Karnataka each, 10 per cent in Gujarat, 9 per cent in Maharashtra, Haryana and Andhra Pradesh each and 7 per cent in MP, Orissa and Rajasthan each (*Uttar Pradesh Aya Vyak ki Rooprekha 1994-95*, p 37).

Per capita plan outlay consequently has been lowest in UP throughout the planning period with the solitary exception of Bihar. But the most disturbing aspect is the abnormal growth in non-developmental expenditure. Declining percentage share of developmental expenditure on revenue account is shown in Table 2.

The percentage share of developmental expenditure has declined from 67 per cent in 1990-91 to 53 per cent in 1994-95. Developmental expenditure is budgeted to increase by Rs 141 crore over the previous year but non-developmental expenditure is to increase by Rs 971 crore. The fastest growth has been in interest payment which increased from Rs 1,181 crore in 1989-90 to Rs 3,271 crore in 1994-95 (BE), i.e. a near three-fold rise in a span of five years. The state government now specialises in creating more tehsils and districts out of the existing ones which has inordinately increased the administrative expenses. Expenditure on legislatures, governor, cabinet, secretariat and district administration increased from Rs 179 crore in 1993-94 (RE) to Rs 712 crore in 1994-95 (BE), i.e. a four-fold increase in a single year (ibid, p 16).

Unable to generate resources the state has resorted to the easy option of borrowings. The total indebtedness of the state government now stands at Rs 31,107 crore and is rising annually by roughly Rs 5,000 crore. Borrowings account for 28 per cent of the total receipts of the state as per 1994-95 budget and annual interest payment accounts for 17 per cent of the total expenditure which is the largest component of expenditure on any head. Repayment of debts accounts for 11 per cent of the total expenditure. Table 3 shows the total expenditure of the government on various heads as per 1994-95 budget on both revenue and capital accounts.

It would be seen that agriculture and allied activities which directly support nearly three-fourths of the population accounts for less than 4 per cent of the total budgeted expenditure. Even after including rural development and irrigation and power the percentage rises to only 17 per cent. Significantly expenditure on administrative

services is more than what is being spent on agriculture and rural development put together. This is also twice the expenditure on health and family welfare. If we add general services and pension to the expenditure on administrative services the combined expenditure is only marginally lower than the expenditure on all the economic services. The expenditure on all the economic services like agriculture, irrigation, power, rural development, industries, etc. does not add to even 20 per cent of the total spending. This only reflects the colonial legacy of administration under a new garb. No wonder that the state ranks lowest in human development index.

It is also worth noting that the expenditure on development heads is not so much oriented towards improving the productive base and the quality of services as in providing berth to the bureaucratic set up. In the name of development what has really developed is a large functionless bureaucracy on whose upkeep a large part of the outlay is utilised leaving little for productive investment.

Take the case of community development. There are 897 blocks in the state with a large army of officers in every block. The lowest functionary used to be called gram sevak, i.e. servant of the village. They resented the word 'sevak' and now they are officially designated as village development officer. The only service now they perform is to make money in selecting the beneficiaries under Integrated Rural Development

Programme (IRDP) and to have a cut of at least 10 per cent in the loan granted to them. The total allocation under community development in 1994-95 budget is Rs 294 crore. Out of it Rs 5 crore is to be spent on gober gas plants, Rs 2 crore on smokeless chulha, Rs 8 crore on drinking water, Rs 1 crore on nutrition, Rs 44 crore on housing schemes for the poor. But the expenses on salary, TA, DA, staff car and its maintenance, etc. is Rs 123 crore (*UP Budget 1994-95*, Sec 5, Part II, pp 117-21). The total assistance under IRDP is Rs 76 crore and an additional Rs 10 crore is to be spent on establishment expenses to execute it. If we take the entire budget under rural development it will be seen that out of a total allocation of Rs 1,170 crore on revenue account in 1994-95, establishment expenses account for 16 per cent. Significantly capital expenditure on rural development is only Rs 17 crore which consists of a capital expenditure of Rs 35 lakh on minor irrigation and another Rs 16.65 crore on community development. Similarly the revenue budget provision for crop husbandry, soil and water conservation and agricultural education and research is of the order of Rs 345 crore but establishment charges account for Rs 155 crore or in other words 45 per cent of the total expenditure. For purchase of vehicles, maintenance and petrol Rs 473 lakh has been provided. Revenue expenditure on agriculture and allied activities in 1994-95 has been estimated at Rs 699 crore which is Rs 44 crore less

TABLE 2: DEVELOPMENTAL AND NON-DEVELOPMENTAL EXPENDITURE

(Rs crore)

Year	Developmental Expenditure	Non-Developmental Expenditure	Total	Col 2 as Per Cent of Col 5
1990-91	6355.92	2947.03	9421.05	67.47
1991-92	6152.52	4070.96	10399.20	59.16
1992-93	7458.83	4989.23	12690.73	58.77
1993-94	7715.72	5812.51	13743.12	56.14
1994-95	7856.75	6782.94	14863.21	52.86

Note: Compensation to local bodies and panchayats ranging from Rs 37.82 crore in 1989-90 to Rs 223.52 crore in 1994-95 has been included in the total expenditure.

TABLE 3: BUDGET ESTIMATES OF EXPENDITURE, 1994-95

Item	Amount (Rs Crore)	Percentage
1	2	3
General services, pension	1,458.90	7.45
Interest payment	3,271.10	16.70
Administrative services	1,920.06	9.80
Education, sports, culture	2,852.40	14.56
Health and family welfare	842.96	4.30
Welfare of SC, ST, backward and social welfare	547.39	2.80
Agriculture and allied activities	711.21	3.63
Rural development	1163.97	5.94
Irrigation, flood control and power	1409.35	7.19
Industry mines and transport	602.40	3.07
Repayment of debts	2251.30	11.49
Loans and Advances	1418.51	7.24
Others	1142.56	5.83
Total	195,92.31	100.00

than the revised estimates of 1993-94. But all the same the salary bill is higher by Rs 81 crore.

The total salary bill of all the departments excluding TA and expenditure on work charged employees in 1994-95 is budgeted at Rs 4,100 crore which eats away almost the whole of state's own tax revenue. The salary bill rose by about Rs 500 crore in 1994-95 while tax revenue rose by less than Rs 400 crore. The total non-developmental expenditure (administrative services, pension and interest payment, etc) rose by Rs 970 crore in 1994-95 over the previous year while revenue receipts increased by Rs 413 crore. The government has been forced to cut down capital expenditure which declined from Rs 1,159 crore in 1993-94 (RE) to Rs 1,059 crore in 1994-95 (BE). The share of capital expenditure in the total expenditure has been constantly declining. The same has declined from 11 per cent in 1984-85 to 8 per cent in 1990-91 and further to 5 per cent in 1994-95. Net capital formation from budgetary resources also declined from

Rs 3,983 crore in 1992-93 to Rs 3,617 crore in 1993-94.

The state also appears to have entered an internal debt trap. The total borrowing is slated at Rs 5,109 crore in the 1994-95 budget while repayment of loans is slated at Rs 2,251 crore. Interest payment is slated at Rs 2,930 crore. The last two add to Rs 5,181 crore which is slightly more than the total borrowings. Thus the state borrows for meeting debt obligations and not for making investments. Further UP's total indebtedness to the centre is Rs 17,056 crore. During 1994-95 the state's borrowing from the central government was to the extent of Rs 2,715 crore. The state paid an interest of Rs 1,656 crore along with repayment of principal at Rs 642 crore to the centre. In other words the net amount of loan received from the centre after paying interest and principal amounted to Rs 417 crore only.

All this points to a grim situation. With declining investment, profligate non-developmental expenditure the state may witness prolonged stagnation.

Transplantation of Human Organs Bill

Curate's Egg

J Amalorpavanathan

The landmark legislation aimed at regulating organ transplantation will only have a limited impact on the unethical practices associated with it.

IN May last a landmark bill was passed in the parliament, which, among other things, seeks to ban the illegal organs trade that is so prevalent in this country. This bill was widely welcomed by the press and a large section of doctors who were disgusted by the way the organs smuggling, especially kidney smuggling, was taking place in this country.

Before subjecting the bill to critical analysis, a short introduction to the transplantation of organs. Medical scientists have devised surgical procedures by which certain organs like heart, lungs, liver and kidneys when they are irreversibly damaged by diseases can be replaced by healthy ones. The organs for replacement can either be taken from a healthy person who is willing to donate one of his paired organs like kidneys or from a dead body, cadaver. But if the body is dead for long, the organs also become dead and hence unfit for transplantation. Hence, the organs must be harvested when they are functioning while the donor's brain is irreversibly destroyed either due to injuries or due to diseases. This is the concept of 'brain death'. The brain dead patients will be totally and irreversibly unconscious while their heart would still be pumping blood to those vital organs of the body. The bill under discussion enables doctors to

certify brain death as clinical death and thereby enables removal of vital organs for transplantations. The transplantation of organs from such brain dead patients is 'cadaver transplantation'. Because of the lack of legislation a cadaver transplantation could not take off in India, although it has already become a routine surgery in many developed countries. But kidney transplantations was done here because one kidney can be taken from a healthy living person without harm.

Before the 80s only transplants between closely related donor and recipient could be undertaken, because transplantation from an unrelated person would lead to immediate rejection of the transplanted organ. That year marked a watershed in the history of transplantation surgery because a wonder-drug cyclosporine was synthesised. This drug would drastically reduce the rejection reaction therefore even unrelated donor transplantation could be undertaken under the cover of cyclosporine. That indeed was a great medical breakthrough. However, the sociological effects of this wonder-drug was entirely different. Cyclosporine was a classic example of that famous aphorism that nothing is 'class-neutral' in this world. In many advanced countries the synthesis of cyclosporine led to the development of

cadaver transplantation programme. The donor, brain dead person is essentially a 'non-relative' to the recipient and hence without cyclosporine this programme could not take off at all.

On the other hand in India, where the poorest of the poor would sell his or her own blood for survival – and this is very common in all the major cities in India – the introduction of cyclosporine did not lead to cadaver transplant programme. It, on the other hand, led to the poor man selling his kidney to combat poverty. And thus was born the most nefarious kidney trade in India, a multimillion dollar business. Very soon India came to be known internationally as the 'kidney bazaar' and Bombay and Madras became notorious in this connection. One locality in Madras, Villivakkam, came to be known as 'Kidneywakkam' because the majority of residents of this area were forced to eke out their living by selling one of their kidneys. The typical scenario would be this: A rich Arab with renal failure would land in one of the dubious nursing homes in Bombay. A poor migrant labourer from Dharavi would be encouraged to 'donate' one of his kidneys and of course, a measly sum of about Rs 25,000 would be given to him. Around Rs 6 to Rs 10 lakh would change hands in this entire deal. Some hospitals were doing 30 to 40 such operations a month and one can imagine the amount of money involved. While many urologists and nephrologists are involved in this racket. Some doctors not only began to oppose this organ smuggling but also worked hard to get this criminal trade banned. Thus was born the present bill.

The bill has several salient features. First, it allows doctors to certify brain death, thus enabling the starting of cadaver transplantation. (Within a few months of enacting this bill, a heart transplant took place in All-India Institute of Medical Sciences, Delhi. The donor was a brain dead individual). Once cadaver transplant starts, the future of this particular field of medical science is immense. At present, it involves high technology and is quite costly but in due course, it can be made cheaper and in government hospitals it can definitely be done free of cost – at least in the case of poor patients. This is one of the welcome features of this bill.

Secondly, apart from cadaver transplants, this bill also enables 'near relatives' to donate kidneys. In the definition of 'near relative' in the bill, the spouse is also included. Spouse may be a 'near relative' from the sociological point of view, but from the medical point of view, the spouse cannot be considered as such because husband and wife are not blood relatives. A spouse can, therefore, be only considered as a 'non relative' from the medical point of view. In a male-dominated country like India, this will put a lot of moral pressure on the wife to donate her kidney

to the husband if he needs one. M K Mani, a specialist, calls this a 'new form of dowry'. Muthusethupathy, another nephrologist in Madras feels that women's organisations must take this up for further study and action.

It is common knowledge that in India, the majority of kidney donors are females and the majority of recipients are males. Renal failure has no special sexual predilection and both men and women are affected equally. While men get transplants, women are probably left to die. A study done at Government General Hospital is revealing. This hospital undertakes only live-related donor transplants and the spouse is specifically excluded from kidney donation. Table 1 shows the proportion of male and female donors and recipients.*

TABLE 1

No of transplants (Since July 1987)	283
Recipients (Male:Female)	223:60 (4:1)
Donors (Male:Female)	110:173 (2:3)

Of first degree relatives, i.e., parents, siblings and children, women form 60 per cent of the total donors (Table 2).

TABLE 2

First degree relative donors (Male:Female = 98:150)	248
Parents	136
Mothers	103
Fathers	33
Siblings	100
Brothers	55
Sisters	45
Children	12
Sons	10
Daughters	2

In such a situation, where already females are the commonest organ donors, if the spouse is treated as a 'near-relative' it would, no doubt, put great pressure on the wives. Apart from not being medically acceptable, if anything untoward happens to the wife during surgery (in trained hands the death rate during this surgery should be less than 1 per cent but correct data are not available), the plight of the family with the dead mother and a permanently-ill father can well be imagined. Therefore, it is neither medically nor sociologically acceptable to include spouse in the list of 'near relative'. On the other hand uncles, aunts, cousins, nephews, nieces can be included in the list since they share some sort of sanguinous relationship with the patient. That would enlarge the number of donors available to the patient and one can choose the best matching kidney.

The most serious objection to the provisions in the legislation offered by many committed doctors is related to the setting up of an 'authorisation committee',

which will authorise a totally unrelated person to 'donate' (read 'sell') his organ to a recipient "by reason of affection or attachment or any other special reason". This is the classical way our rulers operate - banning the organ trade in the main text and allowing it stealthily through a sub-clause. While this clause would make the kidney brokers and organ smugglers happy, many committed doctors feel bitter about it.

All of us know how these 'authorisation committees' would work in practice. As usual the rich Arab would fly down to Bombay. The poor migrant labourer from Dharavi would 'donate' his kidney to the rich Arab "by reason of affection or attachment". The authorisation committee would of course be only too ready to oblige the mega rich. The kidney pluckers - urologists and nephrologists - would also be ready to do their 'professional' jobs. And the petrodollars would 'take care' of all of them. And so the trade would go on with the blessings of the authorisation committee. These are the types of committees that would allow the dangerous nuclear power plants, ecologically dis-

astrous mega power projects, spurious drugs in the market and so on. The sub-clause in effect only adds more middle men in the racket.

There are other fringe benefits in this bill like regulations of hospitals which perform transplantations, laying down criteria for 'brain death', etc. But they are all mere sop to the crusaders of the cadaver transplant programme. Therefore, when the welcome music and applause heralding a new era in transplantation dies slowly what would remain in place is only the dubious 'authorisation committee'. Ultimately what this bill does is to legalise unethical kidney trade. It legitimises the exploitation of the poor by the rich in one more way and will result also in perpetuating the gender bias Muthusethupathy's apt comment describing this bill as 'Curate's Egg - good in parts but rotten as a whole' is therefore a correct assessment.

Note

* Yet to be published data provided by M A Muthusethupathy, Nephrologist, Government General Hospital, Madras.

THE INSTITUTE OF DEVELOPMENT STUDIES, Jaipur

Requires three Senior Faculty at the level of Senior Fellow (equivalent to University Professor) or Fellow (equivalent to University Reader). Social scientists having specialization in Development Policies, Rural Development, Gender Studies, Education and Development and Econometric Modeling will be given preference. Other scholars with proven academic and publication record and research experience in any relevant area of development studies may also apply. Applications giving full details of the academic qualifications, publication record, work experience, and other relevant information should reach the undersigned within three weeks of the publication of this notice. The candidate should give names of three referees to support his/her candidature. Applicant should clearly indicate whether he/she is to be considered for the position of a Senior Fellow or a Fellow. Incomplete or delayed applications will not be considered. Those who have applied in response to an earlier advertisement issued by the Institute need not apply again.

Prof. V.S. Vyas
Director

Institute of Development Studies
8-B, Jhalana Institutional Area
Jaipur 302 004.

Grozny and Return to Big Powerism?

Anirudha Gupta

Kremlin's decision to pit Russia's entire military might against the Chechen rebels, supported as it was by the US and approved by the European governments, reveals the rough edges of an emerging multi-power world with America, Europe (not yet united), Russia, China and perhaps Japan contending for power.

It seems to me that the tendency of the time is to throw all power into the hands of the greater empires, and the minor kingdoms – those which are non-progressive – seem to fall into a secondary and subordinate place...

– Joseph Chamberlain, British minister for the colonies, in 1897.

GROZNY, the Chechen capital, has been reduced to dust. So also our hopes about building a brave – or even a timid – New World. What we see taking place instead is a revival of the Big Power system of the late 19th century. The system proved brutish, dangerous and short-lived. There is no substantial reason to believe that its second version would be less hazardous in any respect. But, first Grozny...

Kremlin's mishandling of the Chechens' claim for self-determination is a subject we leave to more competent hands to analyse and record. What concerns us immediately is the short- and long-term impact of the Chechen war on post-communist Russia and world politics. The decision to pit Russia's entire military might against a ragtag band of rebels in the Caucasus, it now appears, was taken by a small coterie of president Boris Yeltsin's advisers known as the 'party of war'. The decision did not go down well with ordinary citizens. A majority of the members of the *Duma*, lower house of the Russian parliament, criticised the decision. Many of Yeltsin's pro-reform ministers felt unhappy and resigned in disgust. The most influential among them and once the president's chief economic adviser, Yegor Gaidar, warned about the possibility "of a military-authoritarian regime being established in Russia". His view found powerful support from Leonid Petrovsky, a communist deputy.

Opposing the war, a number of human rights organisations publicised gruesome details of violence committed by Russian soldiers against Chechen civilians. Their loud protest provoked a worldwide response, which at one point did appear to have unnerved Yeltsin as he reportedly ordered a temporary cease-fire in Grozny.

But, quite contrary to such reported 'gestures', the Russian army advanced and pounded the centre of Grozny with withering rocket and artillery fire as waves of air attack on Chechen-held parts of the city reached unprecedented ferocity. Did Yeltsin lose control over his generals? Not exactly: for a couple of days later (January 18), we find him making a fine point of emphasising that he was personally in control of the day-to-day running of the war, which he promised would be over "in the coming days".

What intervened in-between to rejuvenate president Yeltsin and his advisers? Not presumably the war, for it was not progressing well. On the contrary, Russian generals were quarrelling and blaming each other; and in Grozny, Chechen rebels were outmanoeuvring and destroying Russian tanks. The war-front, in a word, was becoming a mess. Yet, Yeltsin's spirit soared as the voice of his opponents subsided. Why? Because relief came 'unexpectedly' from western quarters, deploring the violence in Chechnya, the US president, Bill Clinton, reiterated nevertheless his unqualified support for Yeltsin. "Chechnya", he told a conference of US investors in central and eastern Europe (January 13), "is part of the Russian Federation and we support the territorial integrity of Russia". His secretary of state, Warren Christopher, went one step ahead to predict that the \$90 million aid-package for Russia would be approved despite fierce opposition in the US Congress. In New Delhi, around the same time, the US defence secretary, William Perry, gratuitously conceded that Russia had the right to defend its federation (January 15).

Most European governments approved this stand. In Frankfurt, the German Chancellor, Helmut Kohl, pledged full support to the Russian president despite the Chechen crisis: "in the interest of stability, democracy and economic liberalism". And, of course, in the interest of huge German capital sunk in the effort for Russia's economic recovery.

Where did the opponents of the 'war party' go wrong? In holding the illusion

that America and the west would vindicate their stand on Chechnya and force Kremlin to draw back its troops from Grozny. They erred in their judgment in as much as the early Bolsheviks had in expecting that the European working class would rise in support of the October Revolution. In 1918-20, the politically advanced workers of France and Germany deserted the cause of proletarian solidarity. Seventy-five years later, the so-called Crusaders of human freedom turned down any call for help from Russian liberals against a revanchist, neo-nationalist war-party. In their view, a strong and stable Russia, even if fronted and back by soldiers, was preferable to defending obscure rights of ethnic minorities in the Caucasus. Besides, a strong Russia constituted the only barrier to an irredentist upsurge of the 'savage' Tartar and Mongolian hordes. Hence, if Chechnya broke away, others might try to follow. Conversely, if Moscow triumphed, it could send a message to other non-Russian ethnic groups, including those of the newly independent states, that "it will not hesitate to use violence in the face of recalcitrance". In the process, if the war party was emboldened to re-establish Russia's claim as, if not a superpower, at least a great power, it could cause no harm. In the relation among nations – nations which matter – a show of force becomes inevitable. Hence, Chechnya could be allowed to be seen as Russia's Haiti!

Thus, despite the noises the western media raised over the sack of Grozny, the war party was given a green signal to go ahead and crush the Chechens. In particular, the Clinton administration was keen to see a quick end to the war: one, because it was no longer sure how a Republican packed Congress would view its close relations with the current bunch of dictators in Kremlin. Two, a prolongation of the conflict in Chechnya could raise an outcry over the violation of human rights which Washington could not possibly ignore. For, in its new role as the world's Supercop, America had used the issue of human rights to interfere at will into the affairs of other nations and societies. True, it had made several compromises (as in the case of China); but it could not give up the issue altogether without damaging its own image as a do-gooder.

Surprisingly, this attitude suited China, an established big power in the east, and India, an aspiring power to the south of central Asia. Both have a common cause to defend. China's sovereignty on Tibet and India's on Kashmir. Both, therefore, have unleashed state-violence by degrees to keep ethnic unrest under control. Hence, they had reason to be extra-grateful to the

Russian foreign minister, Andrei Kozyrov, when he brazenly claimed that the Chechen crisis was strictly Russia's internal affair. Said Kozyrev, "I recently held negotiations in Geneva and Bern with US secretary of state, Warren Christopher, and German foreign minister, Klaus Kinkel, who unequivocally confirmed their understanding of our stance. The same understanding was displayed by our eastern partners, China and India. Russia's partnership with the leading countries of the world passed the durability test that although there is a very strong opposition in many of them, Islamic countries too are not going to the extreme and are showing restraint."

Yet, at the height of the conflict, Moscow did not hesitate to officially spread the rumour that Islamic militants were backing the Chechen unrest and planning to ignite a 'jihad' throughout the Caucasus. The very idea frightens western Europe. Is it not across the "fault-lines between Christian and Islamic civilisation" that Huntington draws his picture of the coming 'Apocalypse'? "In the coming years", he writes, "the local conflicts most likely to escalate into major wars will be those, as in Bosnia and the Caucasus, along the fault lines between civilisations. The next world war, if there is one, will be a war between civilisations" (*Foreign Affairs*, Summer 1993).

EMERGING PATTERN

Thus, we see the rough edges of a multi-power world emerging. The chief contenders for power will be America, Europe (though not as yet united), Russia, China and perhaps Japan. The unwritten code to bind them together will be that none should abruptly collapse and thereby cause a seismic upheaval in their power equations. This means that Big Powers should support one another in times of crisis – though not always as allies but as amiable rivals. A measure of competition among them will help secure and strengthen a global security system which will discourage "secondary and subordinate" states from over-spending on their weapons and armies.

This explains why the US – as self-appointed chief of the Big Power Club (BPC) – is so anxious to impose a blanket ban on the production and proliferation of weapons of mass destruction by non-nuclear nations. "Our global and regional strategies for 1995", asserts the US secretary of state, "comprise the most ambitious non-proliferation effort in history, beginning with seeking the definite and unconditional extension of the NPT".

It is obvious that an NPT regime, when established, will rule out any further addition to the BPC, even if some other nations happen to acquire nuclear capability. At the most, they can be co-opted into an alliance system which will give them full protection from possible external attack. At worst, they will be branded as "hostile states". Besides, attempts will be made to point out that some BPC members have on their own surrendered their option to go nuclear. Japan, for instance, adheres to its fixed national line of Three Non-nuclear Principles, viz, non-possession, non-production and non-introduction of any nuclear weapons. Although, the third principle raises some criticism inasmuch as the preservation of Japan's security depends on a US-extended nuclear umbrella, the policy has nevertheless helped Japan to restrict its defence-related expenditure to the minimum as well as create a climate for friendly commercial and diplomatic relations with other countries of Asia. Similarly, Germany – where the anti-nuclear sentiment still runs strong – relies on credible deterrence extended by America.

Two arguments follow from the above: First, since some Big Power Club members remain non-nuclear, there is no convincing reason why others outside the Club should not emulate their examples. In other words, possession of nuclear capability and big power status are not one and the same thing. Second, in addition to strengthening its own defence, the US takes on the burden of guaranteeing nuclear protection to its existing and potential allies in Europe, Eurasia and Far East. In this sense, its national security policy cannot be anything but global. This involves that the US should always try to keep ahead in advancing and deploying its missile technology system wherever a threat emerges: "to hedge against unexpected developments which may be a reversal of Russian reforms, or transfer of technology from one of the former Soviet Union countries to Iraq or Iran." Or, any apache ghost the American nightmare can conjure up!

These arguments offer a vision of the coming world order which is palpably discriminatory and, therefore, unacceptable to many of those who aspire to be counted as, if not big, influential actors in the international arena. Surprisingly, these nations make their claim not because they have sufficiently strong or sustainable economies (some would collapse without external dole); but because they have gained sufficient military/technological capacity to produce destructive weapons. Some suffer from megalomania; therefore,

incapable to think anything less than big (Iraq and Libya). Some are willing enough to offer their services to the US, as a global policeman, provided they can keep their nuclear options free (Egypt and India). Others appear to act tough in order to snatch any kind of advantage from the BPC (Israel and North Korea).

We should reserve further discussion of these 'hostile' or 'transitional' states to a future occasion; but some features common to all of them may be noted: (a) whatever be their moral stance, the foreign policies of these states are guided by singularly opportunist and mercenary motives; (b) their preoccupation with defence matters (expansion, modernisation and training of the armed forces) tends to militarise politics to the extent of denying a larger section of population its basic human needs (BHN); (c) in advancing a power-status in world affairs, they progressively desert the ranks of poorer, non-aligned, nations, and (d) their concern for third world solidarity sounds as hollow as America's for the preservation of human rights.

A world system based on power hierarchy cannot be very safe because it stresses the primacy of the military over other aspects of international relations. If anything, it can only stretch the 'fault-lines' across and beyond the nuclear-haves and have-nots.

IMBALANCES WITHIN

Besides, a complex interplay of mutual trust and suspicion among the Big Powers cannot be sustained for long. Nor, perhaps, even in the short run. Thus, for instance:

A great power such as Boris Yeltsin's Russia lacks the economic resources to match its military strength. Nor does it appear to have the political will to rise above its level of extreme dependency on external financial assistance. Being economically disadvantaged, Russia may like to flex its muscle on issues which impinge on western security such as NATO's eastward expansion, or Serbian attack on Bosnia, or any US-inspired nuclear missile-regime. The great debate between the pro- and anti-war groups over the sack of Grozny may also unleash a wave of anti-western sentiment in Russia of the late 19th century vintage. The question of whether Russia is a part of the west or leader of a distinct Slavic-Orthodox civilisation may resurface to throw a spanner into the American-inspired scheme of ranking states according to power. For, to paraphrase Huntington, "If, as the Russians stop behaving like Marxists, they reject liberal democracy and begin behaving like Russians but not like westerners.

(Hence) the relations between Russia and the west could again become distant and conflictual."

Second, the design of a united European security remains as yet incomplete. As sovereign states, the signatories of the Maastricht Treaty are in no mood to give up their own individual perceptions of security. France and Britain oppose any immediate move to include east Europeans into NATO's alliance system. Germany, though favouring a collective security policy, cautions that any expansion of the alliance should be accompanied by "intensive partnership with Russia and Ukraine". Waiving such objections, the US is reportedly trying to make a direct deal with Russia.

Europeans also complain that if the US cannot be relied upon to support one alliance policy (such as towards Bosnia), what is to guarantee that it will support others? The latter, in turn, blames the Europeans for not sharing a part of its defence burden and such out-of-area tasks as UN peace-keeping.

In the east, China as a great industrial and military power-house, remains as inscrutable as ever. Although, it has gradually opened its market to outsiders, it remains as determined as ever to resist any interference in its domestic and economic affairs. Beijing, moreover, is unwilling to accept Washington as supreme arbiter of a multi-power world. Twice it has successfully rebuffed US threats of economic sanctions: first, on account of human rights and, second, on intellectual-property protection. As a general rule, unilateral sanctions are a mistake; but having got used to arm-twisting Japan over the years, Washington thought it could as well bend the octogenarian rulers of Beijing to its will. It has been proved wrong: for, whereas China can absorb business losses, its threat to meet US penalty for penalty has sapped the enthusiasm of American businessmen for the administration's line on intellectual property rights. Noted the influential US-China Business Council, "There is an element of feeling that this is more a fight for Hollywood and Silicon Valley and that we are putting in jeopardy the broader commercial relationship for what is important but still narrow and limited segment of US business in China."

AMERICA AND BPC

This leaves us with America which has taken upon itself the responsibility to establish *entente cordiale* among nations. Why? Because it alone has the capability and the zeal – Calvinistic or otherwise – to wage wars on many fronts: whether it be preservation of human rights, security of

market-based democracies, balancing trade losses by slapping tariff on the goods of others, or bailing out American investors by advancing billions of dollars to near-bankrupt Mexico. Obviously, America's economic offensive reflects an acute crisis in the production and management of the nation's own wealth.

At the same time, as a global policeman, the US has to keep its fighting capacity at all-time high. Thus, defending a \$ 262.2 billion budget proposal for defence, president Clinton urged that US military forces must be able to simultaneously fight two wars of the size of the Gulf operation. Hence, "three tactical US defensive programmes – the army's advanced Patriot missile, the navy's Standard/Aegis programme, and the high altitude air defence programme – will enter full-scale development in 1996-97". The budget also proposes \$1.9 billion for the stockpile stewardship programme and another \$1.6 billion for ensuring the safety and reliability of nuclear weapons. The intelligence budget too needs to be kept at the 1995 level to support this effort.

But, even a policeman needs to go about doing his beat with a 'human face'. He must be seen to be forcefully engaged in fighting the forces of violence and oppression. Hence, while asking for a \$ 21 billion foreign-aid budget, Warren Christopher stated that it contains provisions to intensify the campaign against global terrorism and narcotics trafficking. The budget would help strengthen open global and regional trade "that is so vital to American exports and good American jobs". Besides, US peacekeeping operations, explained the US ambassador to the UN, Madeline Albright, "allows to influence events at a cost and risk far less than if we intervened alone".

America would like to believe that it gives top priority to humanitarian causes in its foreign policy concerns. So that the more it careens towards upholding a shaky big power system, the more emphasis it gives to such causes. But this may not last long – already the administration's initial enthusiasm for human rights has taken a dip, particularly in view of the Republican demand for cutting down the size of foreign aid and peace-keeping. Warren Christopher agreed with his Republican critics that America does not look to the UN "to be effective where swift and decisive application of military force is required to defend our vital interests". Nevertheless, under the circumstances, he maintained "peace-keeping can support efforts to mediate dispute, demobilise belligerents, monitor ceasefires, provide humanitarian relief, and create conditions in which new democracies can succeed".

Translated into simple words: the US can lead the UN to places where it decides to intervene (Somalia and Haiti), and leave it then to complete rest of the operation. In the bargain, it gets a good name as well as the credit of having bolstered the world organisation. And the cost? Ever so charmingly low Albright revealed in a brief that direct US participation in peace-keeping over the last two years has been very modest: "The US ranks 26th among nations in the number of troops participating and US cost for peace-keeping is less than one half of 1 per cent of what we spend for national security."

And the return? Demanded Albright as she added, "Should we discount entirely the benefits to American interests and ideals of successful missions in such diverse places as Namibia, Cambodia, El Salvador and Mozambique - where longstanding conflicts were ended and transitions to democracy begun?"

The point is not that America is playing a gigantic hoax, but that it has been caught up in the mesh of its own success in outwitting – and out-lasting – a formidable rival. The end of the cold war saw the rise of an evangelising America bent upon reordering the world. As the sole surviving superpower, it had the power to strike down its enemies, the will to lead its friends, and the mission to promote market-based democracies. In a word, the American Epoch had arrived.

Yet, this globalisation of American concerns has taken a heavy toll on its vast but limited resources. Partly moved by conviction and partly by circumstances, America has gone on taking too many roles to perform all at the same time. Keeping world peace, maintaining big power system and western security, meeting the economic burdens of uncertain allies, and serving the principles of free market and human freedom as well as refuelling its own declining economy – all these taken together can dwarf the *Twelve Labours of Heracles*. In the process, gloomily predicts Paul Kennedy,

The United States now runs the risk, so familiar to historians of the rise and fall of previous Great Powers, of what might roughly be called "imperial overstretch": that is to say, decision-makers in Washington must face the awkward and enduring fact that the sum-total of the United States global interests and obligations is nowadays far larger than the country's power to defend them all simultaneously (*The Rise and Fall of Great Powers*, p 515).

The warning – alas – may have come a decade too late!

CENTRE FOR MANAGEMENT IN AGRICULTURE

INDIAN INSTITUTE OF MANAGEMENT, AHMEDABAD

Announces

A Summer School for college teachers on Management of Common Property Resources to be held during June 1 - 10, 1995. An inter-disciplinary course with special emphasis on Ecological Economics perspective is organized to equip the young teachers in theory and practice of Common Property Resources.

The Course will also deal with special sectoral areas such as forestry, fishery, grazing lands, water, etc., apart from conceptual issues in transactional costs, political theory of institutions, organizational theory, etc.

WHO CAN APPLY:

College teachers with background in economics, sociology, political science, anthropology, agriculture, ecology and related disciplines having strong interest in teaching and research in common properties with post-graduate degree and some evidence of independent work. Preference will be given to teachers from the colleges located in ecologically disadvantaged regions such as hill areas, drought prone areas, flood prone areas, forest regions, social exchange processes, network, etc.

COST:

The selected candidates will be reimbursed second class train fare and will be provided hospitality besides a set of teaching material. There is no other fee. Candidates may apply with a one page note on their plans to pursue research and teaching in this area along with their copy of bio-data and list of publication to the Programme Officer, **Centre for Management in Agriculture**, Indian Institute of Management, Vastrapur, Ahmedabad 380 015, Gujarat, latest by *April 30, 1995*.

REVIEW OF AGRICULTURE

Agricultural Growth across Crops and Regions

Emerging Trends and Patterns

S D Sawant
C V Achuthan

There has been a significant upsurge in the production and productivity growth in Indian agriculture in recent years and it cannot be attributed merely to a favourable weather. On the contrary, it appears that a shift to higher growth path is underway. A far more important role played by yield improvement in inducing higher growth in output demonstrates that the process of growth has been technologically more dynamic too. Another welcome feature of growth has been its wider dispersal across crops and regions, making it more broad-based in the 1980s.

SUSTAINED growth in agricultural production and productivity is essential for overall stability of the Indian economy. But that is not enough. The aggregate growth rate in agriculture has remained fairly stable and unchanged in the first two decades of the post-green revolution period. What is really required at the present stage of development of Indian agriculture is to step up agricultural growth over and above the rate already achieved in the past. An accelerated growth in agricultural production would not only contain widening rural-urban income disparity but also help in achieving a higher reduction in rural poverty. The question therefore is whether it would be possible to improve output growth in the agricultural sector in the years to come. Do past trends in agriculture justify any optimism in this respect?

Gross domestic capital formation in agriculture at constant prices showed a significant decline between 1980-81 and 1987-88, after registering a steep rise in the 1970s.¹ The decline observed in the rate of growth of fixed capital formation was even steeper. Obviously, there was an apprehension that this adverse trend was responsible for near stagnancy in agricultural production between 1983-84 and 1987-88. However, contrary to this pessimistic assessment Rao (1994)² found that there had been some improvement in agricultural growth in 1978-89 as compared to 1967-78. He attributes it to a better utilisation of the existing infrastructure in addition to growing importance and a wider spread of yield-raising technology in the recent period. Yet, there is a widely shared reservation in this context that a period of successively good monsoons may be mainly responsible for the recent steadiness or improvement in agricultural growth.³ That is to say, the observed improvement in growth may just be a weather-induced temporary phase. Therefore, to have a more realistic understanding of the future prospects of agricultural growth, it is necessary to update the assessment of growth by extending the database beyond 1988-89 as also to make it more rigorous through the meticulous

statistical analysis. Additionally, we also need to look into the trends at the disaggregate level, that is, to examine which crops, in which regions/states indicate relatively higher growth potential and which are showing signs of stagnation. It is equally necessary to identify the sources of output growth of different crops so as to verify whether it is the increase in area or increase in yield or both which contributed to growth. This would help us in identifying the regional patterns of growth which lie behind the macro trends.

Of late, there has also been a frequent reference in the agricultural policy discussions to a need to diversify crop production, particularly in the relatively well developed agricultural regions of India. The objective is to accelerate agricultural income growth and simultaneously make it sustainable too, by promoting cultivation of high value non-foodgrain crops. Are there indications of such diversification taking place in the recent years? If so, in favour of which crops and in which regions? Is diversification based mainly on inter-crop area shifts or does it represent a technologically more dynamic situation involving accelerated increases in productivity of more favoured crops? What are its implications for agricultural income growth? These issues too need to be probed through scrutiny of the latest crop data at the national and the state level, in order to provide right orientation to the policy initiatives required to enhance agricultural growth as also to sustain it in future.

Keeping in view the above-mentioned broad objectives we analyse in this paper the crop output growth and the sources of growth, at the national and the state level using the most recent data.

The paper is divided in two parts. Part A includes four sections and focuses mainly on the aggregate level analysis. Section I describes the coverage and nature of analysis, Section II examines growth performance of three crop groups, namely, foodgrains, non-foodgrains and all crops combined at the all-India level, and investigates whether there has been acceleration or deceleration in their growth in recent years. Section III analyses aggregate

performance of agricultural sector across the states while Section IV presents a scrutiny of cropwise growth in Indian agriculture.

Part B discusses at length the results of the state level analysis of output growth in foodgrains and the major non-foodgrain crops in Sections V to VIII and at the end presents the conclusions of the study in Section IX.

Part A

I

Coverage and Nature of Analysis

Evaluation of agricultural growth performance attempted in this paper is limited to the post-green revolution period only, that is to the years from 1967-68 to 1992-93. Its main focus is on the comparison between the two sub-periods, namely, the period I, i.e., the early phase of the green revolution period covering the years up to 1981-82 and the period II, i.e., the latter phase which includes post-1981-82 years. We refer to these periods also as the 1970s and the 1980s respectively. The study uses the official crop statistics drawn mostly from various publications of the government of India.⁴ It includes 15 major states which together account for nearly 97 per cent of India's foodgrain production and NDP generated in agricultural sector. The states are classified in five major regional groups in order to organise and facilitate the discussion of the state level results as also to trace the regional patterns, if any, emerging in the period under study. The organisation of five regions is as follows:

Southern Region : Andhra Pradesh, Karnataka, Kerala and Tamil Nadu

Western Region : Gujarat and Maharashtra

North-western Region : Haryana and Punjab

Central Region : Madhya Pradesh, Rajasthan and Uttar Pradesh

Eastern Region: Assam, Bihar, Orissa and West Bengal.

Performance is evaluated on the basis of estimates of compound annual growth rates in area, crop production and yield per hectare of principal crops at the all-India and the state level. Additionally, the growth rates

are also worked out by using (i) the series of all-India index numbers of area, production and yield per hectare of foodgrains, non-foodgrains and all crops, and (ii) the national and the state level series of net domestic product generated in agriculture specially to infer about aggregate performance of agriculture.

Compound annual growth rates (henceforth CAGRs) have been estimated by fitting a simple trend function (1) to the time series of three-year averages of area, production or yield per hectare.

$\log Y = a + bt \dots$ trend function (1)
where Y's are the triennial averages of Y, the original observations on area, production, etc., and t is the time variable.

CAGRs are separately computed for two sub-periods for all the data sets and additionally for the entire period in respect of all-India crop aggregates. The periods as mentioned in all the statistical tables are (I), 1968-69 to 1981-82 and (II) 1981-82 to 1991-92, where the year refers to the central year of the triennium. All the statistically non-significant CAGRs are treated as zero growth rates.

The use of three-year moving average series of area, production or yield per hectare, instead of the original series is expected to reduce considerably the influence of extreme variations in climatic factors on the associated estimates of CAGRs. However, the alternative weather adjusted estimates of CAGRs too are worked out for comparison at the all-India level by fitting a trend function (2) in which index of rainfall is explicitly included as an independent variable.

$\log Y = a + bt + CR \dots$ trend function (2)
where R is the all-India annual rainfall index constructed by the Indian meteorological department and Y's are original observations on area, etc.

Additionally, for verification of existence of statistically significant acceleration or deceleration in output growth we estimate a quadratic in time variable by fitting a function (3), i.e., $\log Y = a + bt + ct^2$ to the time series of triennial averages of the all-India index numbers of area, production and yield per hectare for foodgrains, non-foodgrains and all crops. The same exercise has been repeated for the state level foodgrains production series to ascertain emergence of acceleration or deceleration in their output growth.

II

Performance of Foodgrains, Non-Foodgrains and All Crops

Table 1 provides CAGRs based on trend function (1) and the time series of triennial averages of all-India index numbers of area, production and yield per hectare separately for foodgrains, non-foodgrains and all crops for the two sub-periods and the entire post-green revolution period. In addition, it also

reproduces alternative estimates of growth rates of output computed by fitting the trend function (2) to the original series of index numbers of production, for comparison with the former.

It is pertinent to note in this context that estimation of trend functions (1) and (2) yielded statistically significant values of 'b' and 'c' for all the three crop groups and the periods with all the corresponding values of R^2 exceeding 0.95. In other words, the alternative procedure based on explicit inclusion of rainfall index in the trend function did not offer any improvement over the estimation based on trend function (1) and thus proved that the estimates of CAGRs based on trend function (1) and the time series of triennial averages of the variable, were almost free from the effect of rainfall variations, which appear to be essentially random in nature. The subsequent analysis of agricultural growth at the all-India and the state level was therefore restricted only to estimation of CAGRs obtained by fitting trend function (1) to the time series of three-year averages of area, production, etc.

Further, the comparison between the two sets of estimates of CAGRs listed in Table 1 for output of foodgrains (column 3), non-foodgrains (column 6) and all crops (column 9) also demonstrates that the difference between them is very negligible for all the crops groups and each of the three periods. For example, two alternative estimates of CAGRs for foodgrains output are 2.21 per cent and 2.17 per cent for period I, 2.92 per cent and 2.80 per cent for period II and 2.65 per cent and 2.67 per cent for the entire post-green revolution period. The corresponding two sets of estimates of CAGRs for non-foodgrains output are 2.41 per cent and 2.44 per cent (period I), 4.30 per cent and 4.06 per cent (period II) and 3.02 per cent and 3.07 per cent for the entire period. Similarly, alternative estimates of growth rates for output of all crops are 2.29 per cent and 2.28 per cent (period I), 3.43 per cent and 3.26 per cent (period II) and finally 2.7 per cent and 2.82 per cent for the entire period.

The most striking feature of India's agricultural growth in the recent period as revealed by Table 1 is that of decisively superior performance of non-foodgrains *vis-a-vis* foodgrains. Indeed, CAGR of non-foodgrains output realised during 1981-92, i.e., 4.3 per cent exceeded significantly that of foodgrains, namely, 2.92 per cent during the same period. The reason was, non-foodgrains as a group benefited from significant expansion in both the components of production, i.e., at the rate of 1.71 per cent in area under them and of 2.55 per cent in their yield per hectare in period II. In contrast, area under foodgrains actually declined in the 1980s (CAGR = -0.26 per cent). Yet, it is important to recognise that foodgrains output continued to grow at the rate of 2.92 per cent as the growth in yield per hectare of foodgrains exceeded 3 per cent (CAGR = 3.19 per cent) outpacing the negative growth rate in area to a far greater extent.

An emergence of significant negative trend in growth of area under foodgrains (-0.26 per cent) *vis-a-vis* relatively high positive growth in area under non-foodgrains (1.71 per cent) at the aggregate level, mentioned above, implies that in recent years there must have been an increasing shift of land from foodgrains to non-foodgrains. Whether, this phenomenon was almost universal across the states or was restricted to only a few states/regions of the country would be an interesting issue for investigation. But we would examine it in part B while analysing agricultural growth at the state level.

The preceding discussion makes it clear that the non-foodgrains acquired a distinct lead over foodgrains in India's agricultural growth during the 1980s, i.e., the latter phase of the green revolution. Further, between the two sources of output growth dominance of yield over the area component was clearly established in respect of both, the foodgrains and non-foodgrains. Naturally, at the aggregate level too, a far greater contribution to growth in production of all crops which was at the rate of 3.43 per cent came from the yield component (CAGR = 2.93 per

TABLE 1: COMPOUND ANNUAL RATES OF GROWTH (CAGRs) IN INDEX NUMBERS OF AREA, PRODUCTION AND YIELD PER HECTARE

Period	(Per cent)								
	Foodgrains			Non-foodgrains			All Crops		
	Area	Production	Yield	Area	Production	Yield	Area	Production	Yield
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
I 1968-69 to 1981-82	0.37	2.21 (2.17)	1.85	1.06	2.41 (2.44)	1.34	0.54	2.29 (2.28)	1.74
II 1981-82 to 1991-92	-0.26	2.92 (2.80)	3.19	1.71	4.30 (4.06)	2.55	0.49	3.43 (3.26)	2.93
III 1968-69 to 1991-92	0.13	2.65 (2.67)	2.51	1.17	3.02 (3.07)	1.83	0.48	2.79 (2.82)	2.30

Notes: (1) All the growth rates are statistically significant at 5 per cent level.

(2) Values in parentheses are CAGRs obtained by fitting a trend function (2), i.e., $\log Y = a + bt + cRt$ where Y's are original index numbers and R's are the all-India rainfall index numbers constructed by Indian Meteorological Department.

cent) than from the area component, the corresponding CAGR being 0.49 per cent only. This is not surprising in view of the fact that area has long ceased to be an important sources of growth in Indian agriculture.

Again changes which have occurred in the pace and sources of growth in agriculture between period I and period II may provide some indication about the future course of growth. It would, therefore, be interesting to look into the changes in behaviour of area and yield components over the two phases of the post-green revolution period and their impact on the pace of output growth.

CAGR for foodgrains output moved up significantly from 2.21 per cent in period I to 2.92 per cent in period II. Acceleration in output growth rate of non-foodgrains in the 1980s was even more rapid as their growth rate increased steeply from 2.41 per cent in period I to 4.3 per cent in period II. Consequently, growth in output of all crops too accelerated in the 1980s reaching the level of 3.43 per cent from its earlier level of 2.29 per cent realised in the 1970s. Again, the statistical evidence presented in the beginning of this section demonstrates that the output growth rates are free from any systematic variations in rainfall. Thus, recent upsurge in growth appears to be more enduring rather than just a short-lived weather-induced phase.

Changes in relative contribution of area and yield components to foodgrains output growth were also noteworthy. In the 1970s area under foodgrains expanded gradually at the rate of 0.37 per cent but this positive trend was replaced by a negative growth rate of -0.26 per cent in the 1980s. However, much faster acceleration in the growth rate of yield per hectare, i.e., from 1.85 per cent in period I to 3.19 per cent in period II, more than compensated for declining trend in area and pushed up output growth above the level achieved in the 1970s. In contrast, non-foodgrains experienced accelerated expansion both in area, i.e., from 1.06 per cent to 1.71 per cent and yield per hectare, i.e., from 1.34 per cent to 2.55 per cent between the two sub-periods. Indeed, it is remarkable that the pace of growth in yield per hectare of non-foodgrains nearly doubled from the 1970s to the 1980s. Obviously, growth rate of yield per hectare of all crops combined, too moved up from 1.74 per cent in period I to 2.93 per cent in period II. It was this rapid momentum in yield growth across the crops which was responsible, for improved performance of Indian agriculture in the 1980s.

Three conclusions clearly emerge from the preceding analysis. One, at the aggregate level there has been a marked upward movement in the pace of growth. Secondly, the major driving force behind it is the expansion in productivity. Thirdly, and more importantly, the emergence of acceleration

is unlikely to be merely a weather induced phenomenon and appears to be more enduring one. In order to reinforce our third conclusion we investigated further statistical significance of the process of acceleration.

To examine the hypothesis of acceleration in growth over the entire post-green revolution period we fitted the trend function (3), i.e., $\log y = a + bt + ct^2$ to the triennial averages of index numbers of area, production and yield per hectare, separately for foodgrains, non-foodgrains and all crops. The results of this second exercise are listed in Table 2.

In all the regressions for production and yield per hectare, the coefficients of t and t^2 , i.e., 'b' and 'c' both, were found to be positive and statistically significant, establishing significant acceleration in production and productivity growth at the all-India level (columns 3 and 4). But in regression for area, the coefficient 'c' turns out to be negative and significant for foodgrains and positive and significant for non-foodgrains. This implies deceleration in area growth for foodgrains and acceleration for non-foodgrains in the recent period. Aggregate area under all crops naturally shows absence of either deceleration or acceleration in the rate of its expansion ('c' being statistically non-significant and hence zero). That is to say, inter-crop shifts favoured non-foodgrain crops at the cost of foodgrains particularly in the latter part of the green revolution while very slow expansion in aggregate cropped area continued ('b' positive and significant) without any perceptible change in its growth rate.⁵

Thus, our analysis supported an emergence of significant acceleration in aggregate production and productivity growth in Indian agriculture in the recent years. Our next task is to analyse growth trends at the disaggregate, i.e., at the state level to investigate whether all the states or only a few participated in this process by pushing up aggregate growth rates in agriculture in the 1980s.

III Aggregate Performance of Agriculture at State Level

To examine aggregate growth performance of the states in crop production sector we required the state level time series of index numbers of area, production and yield per hectare of all crops combined. In the absence of availability of these data for all the states, we preferred to analyse aggregate growth performance of agriculture across the states on the basis of data on state domestic product originating in agriculture, though the two sets of data are not strictly comparable.⁶ CAGRs computed for this purpose on the

basis of the series of triennial averages of the SDP separately for the two sub-periods are reproduced in Table 3. For comparison, as also to confirm acceleration in growth of aggregate GDP and NDP originated in agriculture, all-India level growth rates are also provided in the same table.

At the all-India level GDP and NDP generated in agricultural sector increased at the rates of 2.16 per cent and 2.15 per cent in period I and 3.28 per cent and 3.34 per cent for the period II. As the data on the all-India level were available for the entire post-green revolution period at constant (i.e. at 80-81) prices a Chow test for structural break was carried out. This too supported the hypothesis of significant structural break at the aggregate level between 1968-81 and 1981-91, reinforcing our earlier conclusions.

Two immediate conclusions emerge from the scrutiny of the statewise results of the agricultural SDP analysis presented in Table 3. One, for majority of the states CAGR values for the periods I and II are statistically significant and the associated R^2 values are fairly high. Secondly, for all but three states (namely, Andhra Pradesh, Gujarat and Maharashtra) CAGR values in period II are higher than the corresponding estimates in period I. In other words, majority of the states contributed to acceleration in agricultural growth, though at differential rates.

Southern Region: There was a far greater improvement in the growth performance of Kerala and Tamil Nadu where zero growth rates in period I were replaced by 2.75 per cent and 3.66 per cent respectively in period II. Improvement in Karnataka was marginal (from 2.47 per cent to 3.21 per cent) while Andhra Pradesh showed decline in growth rate from 2.48 per cent to 1.81 per cent with much steeper fall in the associated R^2 value.

Western Region: Deterioration in the performance of the western region was serious with a far greater decline between the two sub-periods in the growth rates of SDP from agriculture, i.e. from 3.23 per cent to 0 per cent for Gujarat and from 4.48 per cent to 2.24 per cent for Maharashtra. Again very low values of R^2 for Gujarat (0.05) and Maharashtra (0.43) obtained for period II as compared to period I, i.e. 0.60 and 0.83 respectively, demonstrate relatively higher degree of weather-induced instability in agriculture in the region, particularly during the 1980s.

North-Western, Central and Eastern Regions: In all the states from the remaining three regions SDP growth rates moved up from the early to the latter phase of the green revolution. Improvement was exceptionally high in West Bengal (from 2.66 per cent to 6.88 per cent) followed by Haryana, Punjab, Rajasthan and Madhya Pradesh. In the former three agricultural SDP expanded at the rate of about 4.8 per cent while in the latter,

i.e. Madhya Pradesh, growth was at the rate of 2.51 per cent only in period II.

In sum, if we leave aside deterioration in agricultural growth in the western region and in Andhra Pradesh from the southern region the process of acceleration was almost universal across the states in the 1980s. All the states whether growing mainly foodgrains or non-foodgrains or both improved their performance. Naturally, the inter-crop dispersal of growth must have been wider in the 1980s than before. In order to reinforce this conclusion we would now shift the focus of our analysis first to cropwise growth performance at the all-India level and then at the state level in the sections that follow.

IV

Production Growth across Crops

Table 4 provides CAGRs for major crops or crop groups separately for 1968-81 and 1981-91. In the second period rice occupied a leading position among all the cereals with highest growth in output at the rate of 3.87 per cent. Wheat and maize followed it with the CAGRs in output of 3.33 per cent and 2.62 per cent respectively. Performance of the two inferior cereals, namely, jowar and bajra was very poor with non-significant

growth indicating stagnation in their output. Finally, at the aggregate level production of cereals recorded growth at the rate of 2.97 per cent in the 1980s.

The remarkable feature of the growth in output of cereals in the recent decade was that increases in yield were almost solely responsible for it. Contribution of area was either non-significant (as in case of maize and wheat) or significant but negative (e.g. jowar and bajra). The single most exception to this was of rice crop which benefited marginally from area expansion (CAGR = 0.65 percent) in addition to growth in productivity at the rate of 3.25 per cent. In the aggregate, however, cereals lost area at the rate of -0.32 per cent between 1981-91.

Pulses as a group registered low but statistically significant growth in output at the rate of 1.26 per cent in the 1980s. Almost total, contribution to this growth was from pulses other than gram and tur. Output of the latter two major pulses grown in India remained stagnant throughout the second period due to opposite trends in area and yield growth for both of them. Gram experienced decline in area (CAGR = -1.4 per cent) but small positive growth in yield per hectare (CAGR = 0.7 per cent), while tur gained in area rapidly at the rate of 2.28

TABLE 4: COMPOUND ANNUAL GROWTH RATES (CAGRs) FOR AREA, PRODUCTION AND YIELD OF CROPS: ALL INDIA

Crops/Crop Groups (1)	CAGRs for 1968-69 to 1981-82			CAGRs for 1981-82 to 1991-92

Notes: (a) For soyabean and sunflower the period is from 1971-72 to 1981-82.

(b) For sesamum, coconut, soyabean and sunflower the period is from 1981-82 to 1990-91.

(c) For sesamum and coconut period is: 1968-69 to 1990-91

For soyabean and sunflower period is: 1971-72 to 1990-91

* Statistically significant at 5 per cent level.

per cent but its productivity remained unstable and showed negative but non-significant trend. In contrast, rise in yield per hectare of 'other pulses' at the rate of 2.74 per cent was mainly responsible for satisfactory growth in their output at the rate 3.12 per cent. It appears that cultivation of tur has picked up in the states with relatively lower levels of yield but higher degree of weather-induced fluctuations.

Thus, performance of pulses was uneven and unsatisfactory compared to that of major cereals such as rice and wheat during the 1980s. Nevertheless, it was certainly an improvement over the chronic state of stagnation in their output and yield per hectare which prevailed during the early decade of the green revolution.

The above mentioned differential performance of major cereals and pulses notwithstanding, output of all foodgrains expanded at the rate of 2.83 per cent solely due to rise in their productivity at the CAGR of 3.08 per cent. Between the kharif and rabi foodgrains the latter registered a much higher rate of growth in output, viz, 3.23 per cent with no loss of area to other crops. Whereas output of kharif foodgrains increased at the moderate rate of 2.52 per cent despite loss of area at the rate of -0.39 per cent. Decline in area under kharif foodgrains must be a reflection of significant decline in area under coarse cereals such as jowar and bajra while significant yield growth (i.e., 2.91 per cent) must be the consequence of impressive gain in productivity of rice and maize mainly the kharif crops.

Again, a comparison of performance of foodgrains between the two periods clearly shows that for rice, maize and pulses but particularly for the former two, growth rates moved up significantly in the second period. In contrast, growth in output of wheat decelerated remarkably from 5.21 per cent in period I to 3.33 per cent in the second period and that of jowar from 2.61 per cent to 0 per cent. The only encouraging aspect of this otherwise pessimistic phenomenon has been that the fall in growth rate of wheat production was the result of greatly reduced expansion in area (i.e., from 2.6 per cent in 1970s to 0 per cent in 1980s) and not due to decline in the pace of growth in yield per hectare of wheat which, in fact, improved marginally from 2.55 per cent in period I to 3.06 in period II. It is but natural that the overwhelming advantage of area expansion which wheat enjoyed in the early phase of the green revolution, due to its decisive lead in technological progress, is unlikely to continue at the same pace as the other crops begin to benefit increasingly from the technological advances and its wider diffusion. A jump in productivity growth of rice from 1.45 per cent in period I to 3.25 per cent in period II and of maize 0 per cent to 2.46 per cent is a reflection of this phenomenon.

Inferior cereals, however, displayed retardation in growth over the period with a transition from positive to zero growth in jowar output and continued stagnation in output of bajra. Among the pulses only the 'other pulses' improved their growth performance attaining the growth level of 3.12 per cent in period II from 0 growth in output in the early period. But there has not been any perceptible change in the state of stagnation in the output of gram and tur that prevailed throughout the post-green revolution period. At the aggregate level, therefore, pulses as a group registered much less impressive improvement, i.e., from 0 growth in 1970s to just 1.26 per cent in 1980s.

Varying performance of major cereals and pulses apart, growth rate of their aggregate output moved up from 2.33 per cent to 2.83 per cent between the two periods. It was the result of upturn in their yield growth, i.e., from 1.94 per cent to 3.08 per cent. More importantly, between the kharif and the rabi foodgrains, acceleration in output and yield growth in the 1980s was much sharper for

the kharif foodgrains while in the case of the latter output growth rate continued almost unchanged at the pre-1981 level. Thus, near doubling of growth rate in yield per hectare of kharif foodgrains (i.e., from 1.55 per cent to 2.91 per cent) helped in reducing considerably the large disparity in output growth between the kharif and rabi crops that emerged in the early phase of the green revolution. In other words, the period of the 1980s represent an important departure from the early phase of the green revolution, in terms of greater pace of diffusion of technology to the kharif foodgrains.

Oilseeds: All the edible oilseeds registered a high growth in production in the 1980s with CAGRs in their output ranging from 3.36 per cent for groundnut to 19.25 per cent for soyabean. Expansion in both area and yield per hectare contributed to growth. But yield growth played more or almost equally important role in respect of traditional oilseeds such as sesamum (3.3 per cent) and rapeseeds and mustard (4.55 per cent) while area expansion contributed overwhelmingly

All-India	23.0	24.9	100.0	100.0

to growth in production of soyabean (CAGR for area 16.48 per cent) and sunflower (CAGR for area 18.42 per cent). In the aggregate, therefore, production of all nine edible oilseeds expanded at the rate of 6.3 per cent in the 1980s. Indeed, this represents a remarkable improvement over the low growth in their output (at the rate of 1.91 per cent) realised in the early period of the green revolution. The associated CAGRs for area and yield per hectare were at the low levels of 1.15 per cent and 0.75 per cent respectively in the 1970s as against they being 3.46 per cent and 2.76 per cent in the 1980s. This transition from low to very high growth in the oilseeds sector demonstrates the success of special efforts made in terms of development of technology and provision of assured and higher market support to the oilseeds, since the late 1970s and underscores the need to continue this strategy in future too.

Fibre Crops: Production of cotton, the major fibre crop, registered relatively high growth (CAGR = 3.73 per cent) in 1980s *vis-a-vis* moderate rate of 2.78 per cent in the 1970s. Impressive gain in its productivity growth, i.e. from 2.51 per cent in period I to 4.29 per cent in period II was solely responsible for its better performance in recent years.

Performance of jute was unsatisfactory in the 1980s, despite remarkable improvement in its yield growth from 0.81 per cent in the 1970s to nearly 3 per cent in the 1980s. Statistically non-significant growth in jute production in period II appears to be the result of greatly fluctuating yet gradually declining area under jute.

Sugarcane, Potato and Tobacco: Sugarcane is yet another major commercial crop like cotton which has improved its performance consistently throughout the green revolution period, with the CAGR of its production moving from 2.65 per cent in period I to 3.48 per cent in period II. Growth in area under sugarcane continued at the rate of 1.6 per cent through the entire period while yield growth accelerated between the two sub-periods from 1 per cent to 1.8 per cent.

Production of potato expanded rapidly at the rate of 4.71 per cent in the 1980s both due to expansion in area and yield per hectare but much more so because of the former. Yet, it represents deterioration in its impressive growth record in the early phase of the green revolution when output increased at the rate of 7.77 per cent to which again area and yield growth contributed equally.

Growth performance of tobacco was worst in period II with absence of any rise in its output. Among all the non-foodgrains, tobacco is the only crop which suffered from significant loss of area at the rate of -2.22 per cent which neutralised completely positive growth (at the rate of 1.88 per cent) in its yield per hectare. It is possible that with restrictions imposed on area under tobacco,

low productivity lands have been withdrawn from cultivation by tobacco producers. In consequence, the state of moderate output growth in the 1970s was replaced by that of stagnation in output in the 1980s.

Plantation Crops: Tea, the major plantation crop in India revealed consistently stable though moderate growth at about 3 per cent all through the post-green revolution period. Both area and yield contributed to production increase though rise in yield was the dominant source of growth. Marginal decline in growth rate in 1980s over the 1970s, i.e. from 3.02 per cent to 2.75 per cent was mainly due to deceleration in its yield growth from 2.39 per cent to 1.85 per cent. Tea being the major exportable crop of India, it is very disappointing that growth in its productivity could not be accelerated in the 1980s.

Coffee production expanded at the high rate of 3.86 per cent in the 1980s. Both area and yield components contributed almost equally to output growth. Yet, it represented decline in output growth from the pre-1981 level of 4.38 per cent, mainly due to slowing down of expansion in area and not in yield per hectare.

In contrast to moderate and marginally decelerated performance of tea and coffee, natural rubber registered greatly accelerated and high growth in its output at the rate of 8.9 per cent in the 1980s and that too due to unprecedented improvement in its yield growth from 2.51 per cent in period I to 7.06 per cent in period II.

Four important conclusions emerge from the preceding analytical review of cropwise trends in output and yield growth. One, all the major crops excluding coarse cereals, gram, tur, jute and tobacco experienced high growth rates (i.e. about 3 per cent or more) in their output in recent years. Secondly, for

majority of them not only pace of production growth enhanced between the two sub-periods but there was across the board acceleration in the 1980s in productivity growth rates too. Indeed, from among the 22 principal crops, absence of improvement in yield growth was observed only in respect of jowar, tur, tobacco and tea. Thirdly, there was dramatic transition from low to very high growth accompanied by improvement in productivity growth, in the oilseeds sector. Fourthly, sharp upturn in yield growth for kharif foodgrains was also a noteworthy feature of the cropwise growth in the 1980s. Our conclusions, therefore, provide an evidence in support of a wider, greater diffusion of technology in recent years to large number of crops not benefited in the early phase of the green revolution period.

Part B

V

Performance of Foodgrains at State/Regional Level

At the all-India level CAGR of foodgrains output moved up from 2.33 per cent in period I to 2.83 per cent in period II. The upturn in output growth occurred mainly due to significant acceleration in productivity growth, i.e. from 1.94 per cent before 1981-82 to 3.08 per cent in the period subsequent to 1981-82. It neutralised completely the negative effect of reversal of trend in area growth for foodgrains from 0.38 per cent in period I to 0.24 per cent in the latter period.

It is possible that the pattern of changes in growth rates of area, production and yield per hectare of foodgrains between the periods, obtained at the aggregate level is the result of similar changes in all the states or it may

also be the net effect of contrasting patterns across the states. What is, therefore, necessary is to examine trends in foodgrains output growth and the relative importance of sources of growth at the disaggregated level. For this purpose, we analyse the state-level CAGRs for foodgrains in the 15 major states of India (Table 5).

Southern Region: In the 1980s (column 6, Table 5) foodgrains output expanded at the low rate of 1.32 per cent in Andhra Pradesh, remained stagnant with non-significant growth in Karnataka, declined significantly at the rate of -2.29 per cent in Kerala, and increased at a relatively high rate of 3.26 per cent in Tamil Nadu. However, by and large, growth in yield per hectare was not unsatisfactory during this period in all the states with the growth rates ranging from 1.56 per cent in Kerala to 4.11 per cent in Tamil Nadu.⁷ In contrast, growth in area under foodgrains received a severe setback with the negative trend emerging in all the states. The rate of decline in area was highest in Kerala (-3.79 per cent) followed by Andhra Pradesh (-1.76 per cent), Tamil Nadu (-0.81 per cent) and Karnataka (negative but non-significant trend). Thus, during the latter phase of the green revolution, southern region experienced significant absolute decline in area under foodgrains leading to depressed or negative growth in output of foodgrains.

Again, comparison of growth performance between the two sub-periods clearly reveals deterioration in the foodgrain economy of the southern region. Output growth declined steeply from 3.44 per cent in the 1970s to 1.32 per cent in the 1980s in Andhra Pradesh, the leading foodgrain producing state of the region. In Karnataka positive growth rate of 1.99 per cent in period I was replaced by zero growth rate in period II while in Kerala too deterioration was more than evident with a transition from stagnation in the early phase to significant negative growth in output in the latter. Contrary to this, growth performance improved in Tamil Nadu remarkably with a shift from stagnation in production in period I to growth at the rate 3.6 per cent in period II.

As Tamil Nadu represented an exceptional situation of dramatic revival of growth in the foodgrains sector we examined the scatter diagram of the state's foodgrain output. It revealed that high growth rate obtained for the 1980s was a statistical illusion. Successive troughs in the state's foodgrain output in the early 1980s were followed by the process of slow recovery which continued throughout the 1980s, with restoration to pre-1981 level of output coming only at the end of the 1980s. As such, there is no indication of a decisive break in growth environment away from the state of stagnation. A few more observations from the 1990s would be required to ascertain existence of significant revival if any, in Tamil Nadu's foodgrain economy.

Nevertheless, persistence of a negative trend in area under foodgrains in the region as a whole, significant fall in output growth rates in three states and an absence of sustained positive growth in the fourth one (i.e. Tamil Nadu) hints at accelerated deterioration in the foodgrain economy of the southern region in the years to come.

Western Region: Performance of foodgrains in the western region too was characterised by worsening of growth environment from the 1970s to the 1980s.

CAGRs of foodgrain output declined from 5.66 per cent to 2.1 per cent in Maharashtra and from 2.92 per cent to -1.18 per cent in Gujarat. Associated fall in yield growth was equally steeper.

Very high growth close to 6 per cent realised in the 1970s in Maharashtra was partly a reflection of recovery to normal level after severe depression in output between 1970-71 and 1973-74, the successive years of acute drought. Yet, the recovery was quick and was followed by rapid and

TABLE 8: STATEWISE COMPOUND ANNUAL GROWTH RATES (CAGRs) FOR MAJOR NON-FOODGRAINS

Crops/States	CAGRs for 1968-69 to 1981-82			CAGRs for 1981-82 to 1991-92			Per Cent Share in All-India Production (1987-88 to 1991-92)

Statistically significance at 5 per cent level.

sustained expansion in output thereafter. In the 1980s, however, there was absence of similar momentum in the foodgrains output growth in Maharashtra.

In Gujarat, moderate growth in the early period (2.92 per cent) was replaced by a long phase of high fluctuations in output in the 1980s. Indeed, after reaching a peak level of output in 1983-84 the foodgrains output in Gujarat remained greatly depressed and below its 1983-84 level right up to 1992-93. Lack of momentum in growth in the western region can partly be explained with reference to negligible expansion in irrigation in the 1980s accompanied by increased frequency and severity of monsoon failures.⁴

North-Western Region: In contrast to the discouraging performance of the southern and the western regions, the north-western region which spearheaded India's green revolution continued to be the high growth region even in the latter phase of the green revolution. But between the two states, it was Haryana which established a clear lead over Punjab through rapid acceleration in foodgrains production and productivity growth rates, thereby relegating Punjab to the second position.

Foodgrains output increased at a high rate of 4.52 per cent in period II in Haryana while growth rate in Punjab was relatively lower at 3.80 per cent only. Haryana's impressive growth in output even in total absence of supporting expansion in area under foodgrains was due to very high growth in yield per hectare at the rate of 5.1 per cent, double the level achieved in Punjab, i.e. 2.54 per cent. No other state except West Bengal could exceed growth rate of 5 per cent in foodgrains yield per hectare like Haryana in period II.

Comparative performance of Punjab and Haryana between the two sub-periods reveals opposite changes in momentum of growth. Output growth decelerated in Punjab steeply from 5.74 per cent in the early phase to 3.80 per cent in the latter phase of the green revolution. Haryana surpassed Punjab in the latter phase by accelerating output growth rate to 4.52 per cent from its earlier level of 3.6 per cent. The noticeable and most encouraging aspect of this transformation in the north-western region has been that the contribution to accelerated output growth in Haryana was entirely from increases in yield while deceleration in output growth in Punjab was mainly due to decrease in area growth rate (i.e. from 2.34 per cent in period I to 1.23 per cent in period II). Nevertheless, it is necessary to take note of the fact that growth in foodgrains productivity decelerated in Punjab, though marginally, from 3.33 per cent to 2.54 per cent, between the two sub-periods.

Central and Eastern Region: Uttar Pradesh and Madhya Pradesh from the central region are the two major states growing foodgrains. They together claim more than 30 per cent

share in all-India foodgrains production. From among the four eastern states, West Bengal, Bihar and Orissa are the important producers of foodgrains, accounting for a combined share of 18.7 per cent in all-India production with their individual shares being 7.6 per cent, 6.1 per cent and 5 per cent (column 8, Table 5).

In the 1980s West Bengal surpassed all the other states of India in foodgrains output growth with the CAGR of 6.1 per cent. Uttar Pradesh, Orissa and Bihar followed it with CAGR values exceeding 3 per cent whereas in Madhya Pradesh and Assam foodgrains output expanded at the moderate rate of about 2.3 per cent. Rajasthan alone was an exception with almost stagnant and highly unstable foodgrain output in the second period.

The most remarkable feature of the output growth in these parts of India was overwhelmingly dominant contribution of yield increases in expanding output and the

negligible role of expansion in area under foodgrains.

In fact, in the central region trend in area under foodgrains was negative (-0.58 per cent) in Madhya Pradesh and non-significant in the other two states. In the eastern region though trend in area was positive, it remained below 1 per cent in the three states and non-significant in the fourth one, i.e. Bihar. In contrast, growth in yield per hectare of foodgrains was either close to 3 per cent or exceeded it in all the states excepting Assam, it being as high as 5.05 per cent in West Bengal.

Comparison of the growth performance between the early and latter phases of the post-green revolution period reveals a universal trend of acceleration in growth in all the central and eastern states excepting Rajasthan. In Madhya Pradesh, output growth rate moved up steeply from 0.88 per cent in period I to 2.37 per cent in period II despite a significant reversal in the trend in

Notes: * Statistically significant at 5 per cent level, @ Based on triennial averages of the terminal years of the period.

area growth from 0.57 per cent to -0.58 per cent. Rise in output growth rate however was marginal in Uttar Pradesh, i.e., from 2.55 per cent to 3.37 per cent. Yet, this improvement is crucial because the share of Uttar Pradesh in the all-India foodgrains production is not only maximum (21.1 per cent) but exceeds the combined share of Haryana and Punjab, i.e., 17.2 per cent. Moreover, unlike Punjab contribution of area component to expansion in foodgrains output remained negligible throughout the post-green revolution period in Uttar Pradesh.

Change in the growth performance of the eastern region between the two periods was not only much faster but more dramatic too. Absolute stagnation in production and productivity of foodgrains in the early period was replaced by growth rates close to or higher than 3 per cent in all the three important foodgrains producing states of the region, namely, West Bengal, Bihar and Orissa. In Assam growth continued without break with marginal acceleration between the two periods, i.e., from 1.3 per cent to 2.26 per cent. Thus, it is evident that all the major states growing foodgrains from the central and eastern parts of India experienced rapid momentum in foodgrains output growth.

How does one explain this sharp transition in growth environment in the eastern region and upturn in growth in the central region of India? Certainly many factors associated with the wider adoption of new technology such as expansion in irrigation and extension services, development of infrastructure required for distribution of seeds, fertilisers, credit, etc., must have contributed to bring about significant change in the growth environment in these areas.¹⁰ Their elaborate and up-to-date analysis is out of the scope of the present paper. However, we prefer to make a brief reference to irrigation development in this context (Table 6).

Expansion in net irrigated area in the eastern region was just 3 per cent between 1970-81 as against 40 per cent in 1980-91. Share of the region in all-India increase in irrigation therefore jumped from 2 per cent in the 1970s to 24 per cent in the recent decade. This significant gain in irrigation benefits of the region certainly must have played a crucial role in improving growth environment in addition to increased spread of new technology.

In the central region, net irrigated area expanded significantly through the 1970s (by 37 per cent) and the 1980s (by 27 per cent). Though the pace of expansion reduced in the latter decade, the region continued to have significant share in the all-India increase in irrigation which was 56 per cent in 1970-81 and 43 per cent in 1980-91 as against its share in aggregate net sown area being only 36.5 per cent. More importantly, the intra-regional dispersal of irrigation benefits was much better in 1980-91, as compared to 1970-81. In the former period,

Uttar Pradesh was the major beneficiary with 60 per cent share in expansion of irrigation while in the 1980s Madhya Pradesh alone accounted for 50 per cent of the total irrigation expansion in the region and the share of Uttar Pradesh was reduced to 27 per cent. This explains rapid acceleration in growth in period II in Madhya Pradesh and significant growth in the early period followed by further improvement in growth in period II in Uttar Pradesh.

Finally, it is evident from the preceding discussion that behind the relatively less impressive improvement in foodgrains output growth at the all-India level (i.e., from 2.33 per cent to 2.83 per cent) between the two phases of the post-green revolution period, lies a diverse pattern of trends in growth across the regions. At the one end there was significant deterioration in the foodgrain sectors of the southern and western regions while the eastern region underwent remarkable transition from stagnation to high positive growth. Simultaneously, momentum of growth accelerated in the central region and high growth continued in the north-western region.

VI

Pattern of Acceleration in Foodgrains Output: States and Regions

We have concluded in the preceding discussion that the regional pattern of foodgrains output growth has undergone a significant change in the latter phase of the green revolution period. In order to strengthen our inferences further regarding accelerating or deceleration in output growth at the state-level we repeated the statistical exercise of fitting a quadratic in time variable, i.e., $\log y = a + bt + bt^2$ to the time series of triennial average of foodgrains output for all the states for the entire post-green revolution period. The results obtained are reproduced in Table 7.

Statistically significant positive values of 'b' but negative values of 'c' confirm significant deceleration in output growth in Andhra Pradesh, Karnataka and Kerala. Low value of R^2 (i.e., 0.34) along with non-significance of both the regression coefficients establishes existence of high degree of instability and absence of sustained increase or decline in growth in the entire period for Tamil Nadu and support our reservations expressed earlier regarding the possibility of significant revival in its foodgrain sector.

Significant and high positive value of 'b' but significant and negative 'c' establish deceleration in output growth in Maharashtra from high positive growth rate in the early period. In Gujarat, positive but relatively moderate growth in the early phase appears to have been replaced by high fluctuations in output in the second period. Indeed a very poor fit of quadratic and the lower value of

R^2 ($R^2 = 0.21$) for Gujarat confirms again high vulnerability of its agriculture to vagaries of monsoon. Similarly, a relatively lower value of R^2 (i.e., 0.68) shows that agriculture in Maharashtra too must have suffered, though to a lesser extent, from the weather-induced instability in the 1980s.

The estimates of quadratic function obtained for Punjab and Haryana are very instructive. Highest value of 'b' (i.e., 0.0287) among all the states and negative value of 'c' for Punjab confirm its leading position in the early phase of the green revolution and subsequent slowing down of foodgrain output growth in the latter period. In contrast, foodgrains sector in Haryana improved its performance in the latter phase (positive and significant estimate of 'c') over and above the moderate growth ($b = 0.0115$) achieved in the early period. Again, highest value of R^2 obtained for Punjab (i.e., $R^2 = 0.99$) not only indicates extremely good fit of the quadratic function but more importantly displays high stability of Punjab's irrigated agriculture.

The results obtained for the central and the eastern regions too reinforce our inferences based on the states' comparative performance in foodgrains output growth between the two sub-periods. With an exception of Rajasthan coefficient of 'c', i.e., 'c' turned out to be positive and statistically significant for all the central and eastern states establishing emergence of acceleration in output growth. Highest magnitude of 'c' (i.e., 0.0007) demonstrates a far greater improvement in foodgrains output growth in West Bengal than in any other state. Again estimates of 'b' are either statistically non-significant (as in case of Madhya Pradesh, Assam and Bihar) or significant but negative (as for West Bengal and Orissa). They imply stagnation with fluctuations in output in period I in the former three states and fluctuations accompanied by significant depression or negative trend in output in the latter two, i.e., West Bengal and Orissa.

Lastly, non-significance of both 'b' and 'c' together with relatively lower value of R^2 (i.e., 0.66) for Rajasthan implies absence of sustained positive growth in foodgrains output in the entire period along with a high degree of weather-induced instability in the foodgrains sector of Rajasthan.

VII

State Level Performance of Non-Foodgrains

It is not enough to examine performance of foodgrains alone. Growth in output of non-foodgrains too is crucial in determining aggregate performance of agriculture, depending upon their relative share in crop pattern. Furthermore, to the extent that the demand for non-foodgrains is more income elastic and they enjoy relatively higher price advantage over the foodgrains their relative

weightage in aggregate production index may be even greater than their share in crop pattern. That is why, deceleration in performance of foodgrains in any region by itself need not be a cause for concern so long as accelerated growth in production of non-foodgrains neutralises the depressing effect of the former and leads to non-decelerated or even accelerated growth in aggregate index of production. Likewise, accelerated growth performance of foodgrains if achieved at the cost of considerable setback to growth in output of non-foodgrains may lead to deterioration in the overall performance of crop production sector. Therefore, we need to analyse more carefully the performance of non-foodgrains at the state level.

Large number of non-foodgrain crops such as oilseeds, fibre crops, condiments, and spices, vegetables and fruits, plantation crops, etc. are grown in different parts of the country depending upon their adaptability to local agro-climatic conditions and their relative profitability *vis-a-vis* foodgrains. Types of crops grown and their relative weightage in the crop pattern vary considerably over the states. Hence, it would have been ideal if we had state level aggregate index numbers of area, production and productivity of all non-foodgrains combined for judging the relative performance of states in respect of non-foodgrain crops. But such comprehensive statistics for all the years and the states are not available. Therefore, we have tried to evaluate performance of states with the help of two types of analytical exercises.

The first one involves scrutiny of the CAGRs of area, production and yield per hectare for the major non-foodgrain crops in all the major states growing them. It is supplemented by the second exercise which is restricted to a few selected states, where we compare growth in SDP generated in agriculture with that in the state's foodgrain output and output of its major non-foodgrains.

To keep the present paper within the manageable limit in the discussion that follows we present initially the broad overview of the state-level performance of the major non-foodgrains based on the statewise and cropwise CAGRs listed in Table 8. This is followed by our final assessment regarding relative performance of states in increasing the output of non-foodgrains with the help of the second illustrative exercise. Incidentally, it also demonstrates the role played by non-foodgrains in the selected states in improving overall agricultural performance in the recent years.

Production of majority of non-foodgrain crops expanded at moderate to high rates of growth in many states in period II (Table 8). Noticeable deviations from this trend were only of jute in the eastern region and tobacco in the southern region. Again,

for many states growth performance in the 1980s represented a far greater improvement over that in the 1970s. The most distinct and important feature of growth was that in all the regions other than the southern, unlike the past, growth relied dominantly on yield increase, though in a few instances expansion in area too complemented it, leading to very high growth rates.

In the southern region, which experienced pronounced shift in area from foodgrains to non-foodgrains, performance of almost all the non-foodgrains in all the four states in period II was satisfactory and far better than that of foodgrains as a whole, as also better than their own performance in period I. Exceptions were only of cotton and tobacco in Andhra Pradesh and groundnut in Karnataka in which case output growth was non-significant in the 1980s. Area expansion contributed heavily to growth in output of all the major non-foodgrains in this region, the remarkable exception being of cotton in Karnataka. Yield per hectare of cotton in Karnataka increased at the rate of 9.63 per cent in period II, a rate higher than that realised even in a progressive state like Punjab (7.93 per cent). Thus, there is a reason to believe that by and large superior performance of non-foodgrains must have compensated more than adequately poor growth performance of foodgrains in the southern region. Among the four states, however, Andhra Pradesh seems to be the only state where unsatisfactory performance of cotton and tobacco might have overshadowed impressive growth in output of groundnut (CAGR = 6.97 per cent) and chillies (CAGR = 7.43 per cent) thereby depressing overall performance of non-foodgrains in the 1980s.

In contrast to satisfactory performance of non-foodgrains in the southern region, their output growth more or less remained depressed in the western region. Exceptions were of cotton in Maharashtra and rapeseeds in Gujarat. Output of cotton, the major non-foodgrain crop of Maharashtra (accounting for nearly 13 per cent share of total cropped area) expanded at the moderate rate of 2.5 per cent throughout the post-green revolution period. But the production of three other crops, namely, groundnut, sugarcane and chillies did not register significant growth in the 1980s. This represented a contrast to a far higher rate of growth in the sugarcane production of Maharashtra (i.e. 6.59 per cent) registered in period I. On the whole therefore, the performance of the non-foodgrain sector in Maharashtra was less satisfactory in the 1980s, as compared to the early period of the green revolution.

Among all the states, Gujarat with nearly 50 per cent of its cropped area under non-foodgrains performed worse with regard to growth in their output in the 1980s with the unique exception of rapeseeds. Performance

of both groundnut and cotton, Gujarat's two major non-foodgrain crops was disastrous during this period. It may be a reflection of the recurrence of bad-weather years in succession since the mid-1980s in the state and thus underscores the need for a rigorous specification of weather variable to evaluate its performance, more accurately.

By and large all the states from the north-western, central and the eastern regions of India, the regions which performed exceedingly well in respect of growth in foodgrains output did equally well with regard to their major non-foodgrains too, particularly the oilseeds, cotton and sugarcane. In these states growth in output was moderate to high in respect of many non-foodgrains. From among them the performance of West Bengal, Punjab, Haryana and Rajasthan was much more impressive than that of others.

VIII

Non-Foodgrains in Agricultural Economy of States

In order to reinforce conclusions reached in the last section as also to demonstrate the crucial influence of non-foodgrains over the state's aggregate performance in agriculture, we compare growth in SDP from agriculture with the state's growth rates of foodgrains and non-foodgrains output for the two sub-periods (columns 2 and 3 in Table 9). Relative importance of foodgrains and non-foodgrains in the state's agricultural economy and in the aggregate national production is also indicated by their shares in the state's cropped area and in the all-India production under columns 4 and 5 respectively, in the same table. This illustrative exercise was restricted to only six states, two from the southern region and the other four from the remaining regions.

Our choice of the states was guided by the special features of the non-foodgrains output growth displayed by these states in the 1980s. The two southern states, namely, Kerala and Andhra Pradesh topped in diversion of area from foodgrains to non-foodgrains. Area under foodgrains declined in these states at the CAGR of -3.79 per cent (Kerala) and -1.76 per cent (Andhra Pradesh) in the 1980s. The other four, namely, West Bengal, Rajasthan, Haryana and Punjab showed exceptionally good performance in increasing the non-foodgrains output without significant diversion of area away from foodgrains. In fact, two of them, i.e. Punjab and West Bengal represent the other extreme. They have surpassed every other state in expanding the area under foodgrains in the recent years at the rate of 1.23 per cent and 0.99 per cent respectively (column 5, Table 5).

Non-foodgrains dominate the agricultural economy of Kerala. Their share in the state's

cropped area has reached the level of 76 per cent in the recent years with the share of foodgrains dropping to just 24 per cent. Kerala enjoys monopoly in production of rubber and pepper while its share in the country's coconut production is nearly 50 per cent. Its agricultural performance in period I was very poor with stagnation in SDP generated in agriculture to which poor performance of both the foodgrains and non-foodgrains must have contributed equally. But there was marked revival in SDP growth from agriculture (CAGR = 2.75 per cent) in period II, despite significant absolute decline in the foodgrains output at the rate of -2.29 per cent during the same period. It was the result of rapid expansion in output of its major commercial crops with their rates of growth ranging from 3 per cent (rubber) to 9 per cent (pepper) in the 1980s (column 3, Table 9).

In Andhra Pradesh, mainly a foodgrains growing state, even in the 1980s, performance of agriculture in period I was relatively satisfactory with the CAGR of SDP from agriculture being 2.48 per cent. It reflected a much better performance of foodgrains (CAGR = 3.44 per cent) in addition to very high growth (15.21 per cent) in the cotton output, but poor performance of groundnut, its major non-foodgrain crop, as also of the other minor non-foodgrain crops. In the 1980s, however, growth in agricultural SDP decelerated to 1.81 per cent due to much steeper reduction in foodgrains output growth (i.e. from 3.44 per cent to 1.32 per cent) and stagnation in output of cotton and tobacco. High growth in production of groundnut and chillies (at about 7 per cent) could not improve the state's overall growth performance.

In sum, significant revival in the non-foodgrains sector in the 1980s had crucial impact on agriculture's aggregate performance in Kerala but mixed performance of major non-foodgrains was not adequate enough to compensate for significant deceleration in the foodgrains economy of Andhra Pradesh.

Foodgrains dominate the agricultural economy of the other four selected states with their share in gross cropped area ranging from 68 per cent in Rajasthan to 85 per cent in Punjab (column 4 in Table 9). Among them West Bengal revealed exemplary performance in increasing its foodgrains and non-foodgrains output (particularly of rapeseeds and potato) in the 1980s. Naturally, it was reflected in its very high growth in SDP from agriculture (CAGR = 6.88 per cent) between 1981-91, higher than any other states. Rajasthan, Haryana and Punjab followed West Bengal with rise in their SDP from agriculture at the rate of 4.91 per cent, 4.77 per cent and 4.77 per cent respectively.

Rajasthan registered second highest growth rate in respect of SDP from agriculture in period II, stagnation in its foodgrains notwithstanding. It was the result of

unprecedented high growth in the state's output of almost all the non-foodgrains such as oilseeds, cotton, chillies, coriander, onions, guarseeds etc. Their output growth rates ranged from 7.08 per cent to 16.64 per cent. More importantly, growth depended, to a large extent, on improvement in productivity and not on diversion of area away from foodgrains. Indeed, in the absence of significant growth in foodgrains output and with only 32 per cent share of non-foodgrains in the state's cropped area (in 1990-93) the rise in agricultural SDP at the rate of nearly 5 per cent is the most creditable achievement for the state like Rajasthan.

Similar to what happened in West Bengal, in Haryana too production of both foodgrains and non-foodgrains expanded rapidly in period II. Output of rapeseeds and cotton, the two major non-foodgrains, which claims more than 20 per cent share in Haryana's crop pattern, increased at unprecedented rates of 17 per cent and 6.89 per cent respectively. Indeed, there was across the board acceleration in growth rates between the two sub-periods for all the major crops in Haryana. But it was much steeper for non-foodgrains as compared to foodgrains. This explains rise in SDP growth rate for Haryana from 2.93 per cent in period I to 4.77 per cent in period II.

With 85 per cent share in the state's cropped area, foodgrains dominate overwhelmingly the agricultural economy of Punjab. The only non-foodgrain crop, worth the name, grown in the state is cotton. It occupies 10 per cent of the state's cropped area and claims 23 per cent share, the highest among all the states in the all-India cotton production. Though foodgrains output growth decelerated in Punjab from about 6 per cent in period I to 4 per cent in period II, there was steep rise in output growth rate for cotton from 3.25 per cent to 9.14 per cent and in its yield per hectare from 0 per cent to nearly 8 per cent. As a consequence growth in agricultural SDP moved up in Punjab from 3.47 per cent in the early phase of the green revolution to 4.77 per cent in its latter phase.

Thus, it is important to recognise that both in Punjab and Haryana accelerated growth in productivity of non-foodgrains played a very crucial role in pushing the growth of agriculture's SDP close to 5 per cent in the latter phase of the green revolution.

Punjab being mainly responsible for India's success in the early phase of the green revolution, its subsequent growth record is crucial for understanding the future course of output growth in Haryana as also the other states of India where foodgrains dominate the crop pattern. Hence, a few additional comments on the nature of its performance would be helpful.

There has been apprehension that it would be difficult to accelerate further productivity growth in Punjab and therefore a shift of area

away from rice and wheat to high value non-foodgrain crops particularly the horticultural crops with an accent on their processing is necessary to sustain growth in agricultural incomes. But the analysis of crop statistics presented in this paper clearly shows that as yet there is no distinct indication of an emergence of such shift in Punjab. On the contrary, positive expansion in area under foodgrains (i.e. rice and wheat) continues though naturally at a rate fairly lower than that in the 1970s. By now, all the other traditional cereals and crops like gram and groundnut have been almost totally wiped out from the state thereby exposing agriculture to hazards of intensive irrigation combined with monoculture thereby threatening its long-term sustainability. Certainly, the absence of decisively superior technology and price incentives as also of the assured market support to crops other than rice and wheat must be responsible for this phenomenon.

Nevertheless, it is evident that the farmers in Punjab have utilised to a maximum extent the opportunities provided by the recent technological advances in production of cotton to push up growth in agricultural incomes. The lesson is, far greater improvement in technological, infrastructural and price support would be needed in persuading the farmers to shift from foodgrains to non-foodgrains especially in the regions where traditionally foodgrains dominate the crop pattern.

IX Concluding Remarks

Our analysis of India's agricultural growth across crops and regions in the post-green revolution period unfolds interesting dimensions of the new trends and patterns emerged in the 1980s. One thing is clear that there must be an upsurge, a significant one, in the growth of aggregate production and productivity in Indian agriculture and it cannot be attributed merely to a favourable weather. The fact that the role played by yield improvement in inducing higher output growth has been far more important than that of expansion in area indicates that the process of growth has been technologically more dynamic too.

While acceleration in yield growth in recent years has been significant for crops like rice, maize, other pulses, rapeseeds, musamum, soyabean, rubber and cotton, for many other crops yields continued to expand at the rates close to their pre-1981 levels. Again, unlike the past, enhancement in yield growth had been more impressive for non-foodgrains as compared to foodgrains and among the foodgrains for kharif foodgrains *vis-a-vis* the rabi foodgrains. This is an indication of a much wider diffusion of technology across the crops than in the past.

Yet another distinguishing character of agricultural growth in the 1980s has been its wider dispersal over the regions. This is evident from the fact that the foodgrains output growth picked up in many less developed areas from the central and the eastern regions where growth had been sluggish in the early phase of the green revolution. Moreover, with fairly rapid expansion in productivity of non-foodgrains, growth in agricultural incomes too accelerated in majority of the states in the 1980s. In sum, with the wider dispersal of growth across crops and regions, agricultural growth has become more broad-based in recent years.

What do the regional trends and patterns tell us about future course of agricultural growth in different regions of India? The performance of the western region has been most unsatisfactory in the 1980s among all the regions of India, as also compared to its own performance in the 1970s. This may be interpreted as an indication of increasing preference to non-agricultural sectors involving a shift of resources away from agriculture in this predominantly dry farming region.¹² Nevertheless, the role played by adverse weather conditions and the greatly reduced pace of expansion in irrigation in depressing production growth in the 1980s in this region cannot be ignored. Hence, we believe that for ascertaining direction of future change in agriculture in the western region it is necessary to undertake a more careful evaluation of the growth performance by including rigorous specification of weather variable in the trend function and covering a few more years, from the 1990s.

From among the remaining four regions, the southern region shows a distinct downturn in the foodgrains output growth. The trend is mainly caused by a shift of area away from foodgrains and is accompanied by a more than compensatory growth in the output of non-foodgrains. This new trend towards non-foodgrains is unlikely to get reversed in future. On the contrary, it may get further consolidated with the increasingly promising opportunities for the agricultural and agro-based exports emerging due to liberalisation of the Indian economy. Is the southern region then expected to move towards specialisation in non-foodgrains? This would very much depend upon the pace of development of the agro-processing industry and infrastructure for farm exports as also the extent of efficient mobilisation of foodgrain surpluses from the other regions to the southern region.

In the north-western region, though high growth in foodgrains output at the rate of about 4 per cent continued in the 1980s, the growth experience of Punjab demonstrates that sustenance of high growth in agriculture within current techno-economic environment would be increasingly difficult in future.¹³ Crop diversification, howsoever desirable

for sustaining high growth, would not be viable momentum, unless economically more attractive and decisively competitive options to rice and wheat crops come forth.

Keeping in view the likely deterioration of the foodgrain economy in the western and southern parts of India and the declining prospects of high growth in foodgrains output and yield in the north-western states, it appears inevitable that the central and the eastern regions have to share increasingly the burden of India's food security in the years to come. Fortunately, not only the potential to achieve this goal has been promising in these two regions, but they also have demonstrated the ability to do so by responding positively to the special policy initiatives provided in the 1980s and moving away from the early scenario of sluggish growth. A greater thrust on these policies and a commitment of adequate resources for their implementation would therefore be needed to step up further the tempo of growth in this region.

Thus in our judgment, past trends justify the hope for a better future. What is required for its realisation is to strengthen the policies and programmes for broadening further the base of agricultural growth and making it more sustainable. In this context, the role of increased public investment in technological and infrastructural development for agriculture hardly needs to be underscored. A real task lies in achieving increasingly higher inter-crop and inter-regional dispersal of investment and its improved utilisation.

Notes

- 5 Additionally we also used the following two publications of the Centre for Monitoring Indian Economy, Bombay for obtaining crop statistics for the years 1990-91 to 1992-93. (i) *Performance of Agriculture in Major States*, 1967-68 to 1991-92, July 1993. (ii) *Performance of Agriculture*, 1980-81 to 1992-93, May 1994.
- 6 Aggregate cropped area may increase gradually due to rise in cropping intensity or

additions to net sown area depending upon irrigation and technology.

- 6 (i) Index numbers of production of all crops are the weighted aggregates of production indices of various crops, weights being the base year value coefficients of crops adopted from the CSO's national income returns, while the CSO's state domestic product (SDP) series provide value of output in agriculture net of all costs and consumption of fixed capital used in production. (ii) SDP series used for computation of CAGRs for the period I, i.e., 1968-69 to 1981-82 are at 1970-71 prices while those used for period II, i.e., 1981-82 to 1990-91 are at 1980-81 prices.
- 7 Growth in foodgrains productivity both in period I and II at the rate higher than 3 per cent in Andhra Pradesh can be explained with reference to continued expansion in the net irrigated area throughout the post-green revolution period in the state. Again, for marginal decline in foodgrains productivity growth in period II in Karnataka and marginal improvement in Kerala similar changes in the rate of expansion in irrigated area under foodgrains must be partially responsible. However, net irrigated area remained almost unchanged in Tamil Nadu between 1970-71 and 1990-91. This appears to be inconsistent with the estimate of high growth rate in foodgrains productivity (4.1 per cent) and hence requires careful scrutiny of the crop statistics for Tamil Nadu.
- 8 In addition to adverse weather conditions negligible expansion in irrigation in the 1980s, i.e., only 5 per cent as against 35 per cent rise in net irrigated area in the 1970s must be responsible for decline in foodgrains output growth rate in Maharashtra. In respect of Gujarat, however, higher frequency of monsoon failures must be mainly responsible for acute stagnation in foodgrains output, though expansion in irrigated area too slowed down from 66 per cent in 1970s to 25 per cent in 1980s in the state.
- 9 A view has been expressed that the reliability of the basic crop data of West Bengal for the 1980s is doubtful (Ray S. Datta, *Economic and Political Weekly*, July 6, 1994; 1883-84). However, in absence of any authoritative judgment on this controversy, we prefer to ignore it, in the context of the present study.

- 11 Nearly 75 per cent area under rapeseeds is irrigated in Gujarat.
- 12 Ahluwalia Deepak, 'Growth Performance in Indian Agriculture', *Journal of Indian School of Political Economy*, Vol 3, No 4, October-December 1991.
- 13 Growth in area under foodgrains in Punjab has been reduced to half in the second period (i.e., from 2.34 per cent in period I to 1.23 per cent in period II) and there is almost no scope for further expansion in area. Productivity growth for foodgrains too decelerated from 3.33 per cent in period I to 2.54 per cent in period II (Table 5). With the current level of irrigation in the state being 95 per cent and area under rice and wheat accounting for 94 per cent of the cropped area under foodgrains sustenance of high growth in foodgrains output would be increasingly difficult in the north western region.

Oilseeds Development and Policy

A Review

K N Ninan

This article attempts to review the past performance of the Indian oilseeds sector and assesses the emerging scenario and various policy options for the sustained growth of this sector.

INDIA's oilseeds sector has witnessed a dramatic turnaround in its fortunes recently. Owing to the changed policy environment, various incentives and institutional support given for the development of the oilseeds sector, following the constitution of the technology mission on oilseeds (TMO), India's oilseeds output has crossed 21 million t during 1992-93, which surpasses the target of 18 million t fixed for being attained by the end of the Seventh Five-Year Plan. This implies that our oilseeds output has been increasing at over 6 per cent per annum, or even more in the last five years or so. This seems to have largely come about through a rapid rise in the production of rabi oilseeds like rapeseed-mustard, rabi groundnut and non-traditional oilseeds like soyabean, sunflower, etc. If this momentum is maintained it should not be difficult for India to attain, and even surpass the target of 26 million t of oilseeds production set by our planners for being realised by the year 2000.

An attempt is made here to review the past performance of the Indian oilseeds sector and assess the emerging scenario and various policy options for the sustained growth of this important sector of the Indian economy. Owing to rising incomes, population, urbanisation, industrialisation and other factors, the demand for vegetable oils and fats has been rising rapidly, at over 4 per cent per annum. Demand projections made by the National Commission on Agriculture, 1976 (NCA) and others indicate that the demand for vegetable oils by the year 2000 will range between 8 to 10 million t or even more (*vide* Ninan 1989). Projections made by the Planning Commission too envisage the demand for vegetable oils to increase to about 8 million t by the year 2000, which is equivalent to about 26 million t of oilseeds. Supply projections made by the NCA indicate that if the required investment takes place, if the average yields of oilseeds were to increase to over one tonne per ha as against the present level of about 0.7 tonne per ha (now nearing or around 0.8 tonne per ha or so), and if the area under irrigated oilseeds were to increase to over 5 million ha as against the present level of 2 to 3 million ha, then supply of vegetable oils may go up to about 9.7 million t by the year 2000. Other studies indicate that not only is the projected

supply likely to be at a lower level, but also the deficit would be of the order of 2.8 to 4.5 million t by the year 2000 [Meenakshi *et al* 1986]. When these gloomy forecasts were made, India's oilseeds production was stagnating at the level of 11 to 13 million t during the early 1980s. It was also not responding to the various price and other incentives due to economic, institutional and technical constraints. Imports of edible oils averaged about Rs 1,000 crore per annum during the early 1980s which ranked the highest in our import bill after petroleum and fertilisers. This scenario no longer exists with imports dwindling to a negligible amount. In fact from a net importer of oilseed products, India has become a net exporter.

In reviewing the past performance of the oilseeds sector in India, one cannot ignore the fact that area has continued to be the major source of output growth of oilseeds. Land being a limiting factor in Indian agriculture, the prospects for increasing oilseeds production further or for that matter of any other crop, through expansion of area is diminishing fast. With environmental concerns and movements picking up in the recent years, the possibilities of converting forest lands to crop production are also extremely limited, if not impossible. Here, however, we may note that there are several tree crops of forest origin such as mahua, sal, karanja, kusum, neem, etc, which if properly exploited could meet a significant part of our vegetable oil requirements. However, some experts have warned that this could accelerate the denudation of our forests. This apart, the only alternative to increase area under oilseeds is to displace other crops or utilise fallow lands. There are, in fact, evidences to show that some of the expansion in oilseeds area in the recent past has been at the cost of area under coarse cereals and pulses [Acharya 1993]. Whether this is desirable or not is open to debate. Coarse cereals and pulses being the main source of calories and proteins for the low income groups, or vegetarian diets in India, the rationale behind increasing oilseeds area as observed after the advent of the TMO, at the expense of coarse cereals and pulses area could be questioned. However, by improving productivity of coarse cereals for which viable technology exists, it is possible to reduce the area under low value

crops like coarse cereals and use the area so saved for cultivation of more remunerative and high value crops like oilseeds, superior cereals, horticultural crops, etc. So also scope exists for diverting some unirrigated wheat or rainfed rice area to grow oilseeds and more remunerative crops in a number of states. This will help in rational and optimum use of a scarce resource like land. The strategy of increasing oilseeds production should constitute an integral component of the country's overall strategy to promote sustained and balanced growth of the agricultural sector so as to meet the demand for diverse agricultural commodities. There is also scope for increasing oilseeds production through inter-cropping, relay cropping and interposing oilseeds in crop sequences or farming systems.

While, as mentioned above, expansion in area has provided the major impetus to oilseeds growth in India, increases in yields too have been playing an important role in output growth of oilseeds in several districts and in respect of specific oilseeds in recent years. A recent study reveals that out of 87 districts from the five major groundnut-producing states of India studied, 35 districts (i.e. over 40 per cent of the districts) recorded a significant increase in aggregate groundnut yields [Ninan 1993]. However, this also includes several minor groundnut-producing districts. This study noted that in Tamil Nadu though the rate of increase in groundnut production has been slow in recent years, yields have registered an increase (and statistically significant too in most cases) in all districts. So also quite a number of districts in Gujarat, Karnataka and Andhra Pradesh have reported modest to significant increases in groundnut yields in the recent past. Though the long-term growth rates for groundnut for the period 1949-50 to 1990-91 indicate groundnut area to have increased faster than groundnut yields (the compound growth rates being 1.16 and 0.69 per cent per annum respectively), the trends for the last decade from 1980-81 to 1990-91 indicate that the rate of increase in groundnut yields (1.82 per cent per annum) has been marginally higher than in area (1.75 per cent per annum). The role of yields has been more prominent in the growth of other oilseeds like rapeseed-mustard, safflower, etc [Ninan 1989]. The wide differences in oilseed yield rates across

districts and states in the country indicates scope for further increasing their yield levels. Improved/hybrid varieties of various oilseeds have been developed, which, if popularised, could give 20 to 50 per cent or more yields as compared to present strains. Available information indicate that 200 varieties/hybrids of various oilseeds suitable for diverse agro-climatic situations and environments have been developed, 50 of them in the last five years alone by various research and scientific labs which have a genetic yield potential of two to four times more than the national and state averages. ICRIASAT has developed groundnut varieties which can yield three to five tonnes per ha, i.e. six times the national average yield [Shenoi 1993]. However, due to various production and market risks farmers appear to be reluctant or slow to adopt the improved technology because of the high investment requirements in terms of fertilisers, pesticides, other inputs, and more so because oilseeds cultivation is concentrated in high risk regions where returns on investment are uncertain [Ninan 1989]. Shortage of certified quality seeds due to constraints in large-scale multiplication, high cost of oil seeds due to high overheads, and the low priority given to oilseeds research and development in the country until the advent of the TMO in May 1986, are some of the reasons for the low adoption rates of improved technology [Ninan 1989]. It has, for instance, been noted that the availability of certified seeds is not commensurate with the breeder and foundation seeds produced which indicates weaknesses in the seed production chain. The production of hybrid seeds is also not able to meet even 10 per cent of our requirements. Many of the varieties currently grown have become obsolete and in need of being replaced by hybrids if our oilseeds output is to keep pace with the growth in domestic demand. Also the slow transmission of improved/hybrid oilseed varieties from the lab to the farm indicates weaknesses in our extension system. However, as noted earlier, after the constitution of the TMO and a more favourable policy environment oilseed yields have been looking up and recorded modest to significant improvements in diverse agro-climatic situations and regions.

Though irrigation is known for its yield-enhancing effect, coverage of irrigation for oilseeds in general and kharif oilseeds in particular is low as compared to other crops like wheat, rice, sugarcane where returns are more and risks low. Yields of oilseeds under irrigated conditions is substantially higher (about two to three times higher) as compared to yields secured under rainfed conditions. Further, oilseeds require less water than other crops like rice. In fact, water required to irrigate one acre of area under paddy is sufficient to irrigate about four acres of area

under groundnut [Ninan 1989]. However, growth of irrigation for oilseeds has been slow. Moreover, evidence indicate that if irrigation is available farmers prefer to switch over to other crops like wheat, rice, sugarcane, etc [Ninan 1989]. Though large-scale diversion of irrigation for oilseeds is not possible or even desirable from the view point of promoting balanced agricultural growth and other considerations, the policy of irrigation water being expropriated by one or two crops to the neglect of other crops is liable to be questioned, among others on equity and sustainability considerations. There has, for instance, been a live debate in Maharashtra regarding the available irrigation water being exclusively used for sugarcane cultivation and large holdings, neglecting other crops which are concentrated among small farms and in the semi-arid tracts. Proper irrigation planning and water budgeting can help in better and optimum utilisation of a scarce input like water. There is a need for special incentives and measures to increase the coverage of irrigation for oilseeds. Apart from including it in the recommended crop pattern for command areas and also shifting some of the irrigated area in favour of oilseeds, charging cess for irrigation water on a volumetric basis (since oilseeds consume less water), protective irrigation and water harvesting in dry regions are some of the measures suggested in an earlier study, and which are as relevant today [Ninan 1989].

Risks in production and marketing of oilseeds and oilseeds products are relatively high as compared to other commodities and have acted as a constraint for rapid expansion of oilseeds production in India. Cultivation of oilseeds in India, as noted earlier, is concentrated in high risk regions where returns on investment are low and uncertain. Only around 20 per cent of oilseeds area receives irrigation support, the remaining area being concentrated in regions with low or uncertain rainfall and marginal lands. Consequently weather-related production risks are quite high in respect of oilseeds cultivation, particularly kharif oilseeds where unlike for rabi oilseeds, coverage of irrigation is very low. Timely arrival of the monsoons as also good distribution of the available rainfall are crucial for the healthy growth of groundnut and other oilseeds. As the study cited earlier indicates, rainfall is a major factor behind variability of groundnut yields in all the major groundnut-producing states of the country [Ninan 1993]. However, as noted earlier, it is not the sole factor causing variations in groundnut yields and there are other socio-economic, agronomic and institutional factors too which may account for the variability of groundnut yields. An analysis of the nature of association between monthly rainfall and kharif groundnut yield variations indicated

that excess or shortfall in September rainfall emerged as a significant factor in explaining variability of kharif groundnut yields in several districts [Ninan 1993]. In other words, it is the excess or shortfall of rainfall in the last lap of the south-west monsoons which is pulling up or down the kharif groundnut yields levels. A peculiar thing about groundnut is that unlike for most other crops, for groundnut the product (i.e. the groundnut pod) develops below the soil and hence, if the groundnut pods are to be harvested without damage, requires adequate moisture or irrigation to loosen the soil at the time of harvest. This indicates the need for protective irrigation in this critical stage. In respect of irrigation, though its yield-stabilising role is well recognised, if it is not used efficiently it could aggravate crop yield instability. An analysis of the variability of rabi groundnut yields across districts revealed that though districts with assured sources of irrigation such as canals, tube-wells reported lower level of instability in rabi groundnut yields as compared to other districts, there were also districts with assured sources of irrigation reporting high instability in rabi groundnut yields [Ninan 1993]. In other words, the efficiency with which irrigation water is used is also a factor to be reckoned with in explaining variability in rabi groundnut yields. The occurrence of good or bad years for groundnut in India does not follow any cyclical pattern and is random in nature [Ninan 1993]. A redeeming feature is that a good or bad harvest of groundnut is mutually compensating across states and districts, which will help in risk management and coping with a bad harvest in one region or district through reaping a good harvest in another region or district. Crop, varietal and spatial diversification are time-tested risk management strategies and hence the trend towards diversifying India's oilseeds economy by encouraging cultivation of diverse oilseeds and also in traditional and non-traditional areas will help in managing risks and stabilising our oilseeds sector. Oilseed varieties have also been evolved which are drought-tolerant and capable of withstanding other stresses including various pests and diseases suitable for diverse agro-climatic regions and environments, which if popularised could help in reducing fluctuations in yields of oilseeds. Market-related risks are also quite high for oilseeds in India. Dominance of private traders and intensive speculative activities in trading of oilseeds is a conspicuous feature of India's oilseeds economy and the oilseed growers have always been at the receiving end. Though there has been a secular rise in oilseed/oil prices they are also subject to wide seasonal fluctuations. The benefit of a price rise has gone more to the trader than the grower [Ranade 1982, vide Ninan 1989]. On account of cash and other pressing

requirements, oilseed growers generally prefer to sell off their crop immediately after harvest which leads to a drop in oilseed prices in the post-harvest season. However, because of intensive speculative and trading activities, dominated by a few players, oilseed prices used to be artificially depressed soon after the harvest to the detriment of the oilseed growers. It is estimated that the spread between the post-harvest and lean season prices was as much as 75 to 100 per cent for groundnut in India as against a reasonable 40 per cent [Shenoi 1993]. As a result, the oilseed grower received only 50 to 60 per cent of the consumer rupee [Shenoi 1993]. These factors are a disincentive to oilseed growers. Through administrative interventions, establishment of co-operatives and regulated markets, the role of the middlemen and other exploitative elements in the oilseeds trade is being reduced, if not eliminated, so as to give a fair deal to the oilseeds growers and consumers.

The role of price and technology in stimulating agricultural growth is well established. In the case of oilseeds, both price and technology have been observed to be important variables influencing their supply response [Ninan 1989]. However, while acknowledging the role of price in stimulating production, and in enabling a farmer to offset a decline in his income from oilseeds cultivation on account of declining or stagnant relative yields through an increase in price, in a dynamic setting it is technology which is a more important factor [Ninan 1989]. This is because development of cost-effective or high yield low cost technology can itself change the scenario for oilseeds. An earlier study noted that while price of oilseeds *vis-a-vis* prices of its competing crops had registered a significant increase during the period 1954-84, yields of oilseeds had either declined or remained stagnant in relation to that of its competing crops during the same period [Ninan 1989]. Technology, therefore, seems to be the major constraint to increasing oilseeds production.

India's strategy for increasing oilseeds production lays emphasis on both ensuring remunerative prices to the oilseeds growers as also developing and popularising viable technologies that will increase productivity at low cost. The price support operations for the oilseeds sector in India are at two levels – one is a farm price support scheme administered by the National Agricultural Co-operative Marketing Federation (NAFED) which provides floor price for six major oilseeds, viz, groundnut, sunflower, soyabean, rapeseed-mustard, safflower and toria. However, the need for NAFED's intervention in the oilseeds market has not risen or been negligible in the past since prices of groundnut and other oilseeds have

always remained well above the support price. The other price support operation is by the National Dairy Development Board (NDDB), which was assigned the task of intervening in the wholesale market through the market intervention operation (MIO) by the government of India in April 1989, to maintain the wholesale price of groundnut and mustard oil within a price band specified by the Empowered Committee on Oilseeds Policy, constituted by the government of India. During the oil year 1988-89, for instance, the wholesale price band for groundnut oil was fixed at a minimum of Rs 20,000 per metric t and a maximum of Rs 25,000 per metric t. Similarly for mustard oil these price bands were Rs 17,000 and Rs 23,000 respectively. This spread of around 35 per cent between the two levels was considered adequate to cover the cost of storage, processing and a fair return on investment [Shenoi 1993]. During 1990-91 and 1991-92, no price bands were declared due to a variety of reasons such as shortfall in domestic production, uncertainty in imports, etc. However, the NDDB was able to contain the intra-year price spread of groundnut oil within the reasonable limit of 30 per cent, and 45 per cent in the case of mustard oil. Prior to the MIO the intra-year price spreads of major edible oils despite huge edible oils imports had been as high as 80 to 100 per cent, whereas after the MIO, this spread had reduced to 30 to 50 per cent.

However, there is a body of opinion that argue that lack of remunerative prices, at least until the advent of the TMO, was the main constraint to increasing oilseeds production [Cf Kurien 1986, *vide* Ninan 1989]. Supporters of this viewpoint were also critical of the policy of importing edible oils which unduly depressed domestic prices and turned out to be a disincentive to increasing oilseeds production. But Indian oilseed and edible oil prices have ruled higher than world prices for several years in the recent past. A study by Professor Dantwala also noted that the wholesale price index for oilseeds being 347.7 in 1986-87 was distinctly higher than for cereals and cotton, being 276.3 and 184.7 respectively [Dantwala 1987]. Further, the annual rate of increase in oilseed prices from 1950-51 to 1986-87 has also been higher than that for other agricultural commodities. The rate of increase was relatively much higher for the period beginning from 1970-71. Further, the study observed that during the last decade price parity measured by the wholesale price index had moved distinctly in favour of oilseeds. The percentage increase in procurement/support prices for different crops between 1975-76/1977-78 and 1985-86 indicated that the increases in support prices for different varieties of oilseeds had been more generous compared to increases

in the support prices of other agricultural commodities. In fact, as mentioned earlier, market prices of oilseeds have always ruled higher than the support prices, and the need for NAFED's intervention in the oilseeds market never arose or at most been negligible in the past. The ministry of finance's index of edible oil prices (with 1970-71 as base) stood at 423 points during 1988-89 as against 408 for all food commodities. In most recent years the edible oil price index has stood at a higher level than for all food items. In 1986-87 and 1987-88 it also ruled above the general price index for all commodities. From this it is clear that price has not been the major constraint to expanding oilseeds production and that other factors like lack of a viable or acceptable technology, greater risks associated with production and marketing of oilseeds, priority to increasing foodgrains production may explain better this constraint. The TMO and other agencies have been addressing to some of these issues by developing and popularising better and viable technologies as also giving incentives to cover the various risks associated with oilseeds cultivation. Its efforts seem to have borne fruit as evinced by the rapid rise in the growth rate of oilseeds from the secular growth rate of 2 per cent per annum or below during the last three or four decades to over 6 to 8 per cent per annum during the last five years from 1988 to 1992. A strategy which relies on the price mechanism has also limitations and important implications. Since coarse cereals, the main staples of the low income groups are the main competitors of oilseeds, any price policy favouring oilseeds, will be at the cost of coarse cereals by creating disincentives for producing coarse cereals. In fact, the surge in oilseeds output during the last five years has partly come through diverting coarse cereals area to oilseeds cultivation, as noted earlier. The profitability of a crop is not determined by price alone, but also by other factors like yields, cost of inputs, risks, etc, and hence a strategy which relies on the price mechanism to boost oilseeds output has its inherent limitations. It is also well known that the aggregate supply response of agriculture is low. Moreover, the Indian experience shows that it was only when there was a technological breakthrough that production of wheat and rice recorded a spectacular rise. This can be true for oilseeds also.

The mounting deficits in our domestic oilseeds production and rising import bill prompted the government of India to give a special thrust to boosting our oilseeds production by providing suitable incentives and institutional support. This resulted in the constitution of a technology mission on oilseeds by the government of India in May 1986, as mentioned earlier. The mission's aims are to harness the best of production,

processing and management technologies to realise self-reliance in the oilseeds and vegetable oils sector through the following: (a) improvement of oilseed crop technology by developing improved/hybrid crop varieties that give high yields, reduced crop duration, tolerant of droughts, other stresses, and with better resistance to pests and diseases, with other desirable attributes and also varieties suitable for cultivation in diverse agro-climatic situations and environments; (b) improvement of post-harvest and processing technology by developing modern integrated processing technology, stepping up oil extraction from oilcakes and also improving traditional oil-ghanis; (c) transfer of technology and farmer support systems like distribution of quality seeds, fertilisers, pesticides, credit, implements, etc. (As part of this programme a Rs 170-crore National Oilseeds Development Project (NODP) covering 180 districts in 17 states was taken up for implementation. Another project known as the Oilseeds Production Thrust Project (OPTP) with a budget of Rs 125 crore covering 246 oilseed-growing districts of the country was also taken up for implementation from 1987 onwards. The NODP and OPTP were emerged into a single programme during 1990-91 called the oilseeds production programme (OPP). The OPP covers 282 oilseed-growing districts spread over 18 states. Total costs of the programme are to be shared between the centre and states on a 75:25 basis. The total planned outlay for the OPP during 1990-91 was Rs 69.97 crore. The programme covers all the major nine oilseeds cultivated in India), and (d) finally, the TMO also seeks to guarantee support prices to farmers and support to industry in the co-operative and private sector for processing, storage and marketing. The impact of the TMO and other programmes on the Indian oilseeds sector has been spectacular, as mentioned earlier with production of oilseeds which was stagnating at around 11 to 13 million t during the mid-1980s rising to over 21 million t during 1992-93 within the short span of five years or so. This means that the growth rate in oilseeds production has accelerated to over 6 per cent per annum during the last few years which represents a clear break from the secular growth rate of 2 per cent per annum or below recorded by oilseeds production in the previous three decades or so, as noted earlier. How far this growth momentum can be maintained needs to be seen.

Along with the TMO, the NDDB has been assigned an important role in restructuring India's oilseeds and vegetable oils sector from 1989 onwards with a view to eliminate the role of middlemen in oilseeds trade and also help the oilseeds grower to realise a higher share in the consumer rupee. Under this programme, the NDDB has been

bringing farmers together under Anand-type co-operative federations. These co-operatives procure oilseeds directly from its members, i.e., the oilseeds growers, provide technical input and extension services for production enhancement programmes and also look after all activities right from procurement, processing and marketing to final sale of product (Mukunda Das 1987). In the process not only are farmers paid a fair price based on standardised quality assessment but also the consumers are given a quality product at a fair price. By June 1992, NDDB had helped set up 5,017 Anand-type oilseeds co-operative societies affiliated to nine state federations with a membership of over 8.2 lakh oilseed growers cultivating an area of nearly 20 lakh ha [Shenoi 1993; Men 1993]. These nine state federations have also developed significant storing and processing facilities, with storage capacity for 1.7 lakh t of oilseeds and 2.77 lakh t of oil, oilseed crushing capacity of 3,310 t of seed per day, solvent extraction capacity of 1,980 t per day as well as refining capacity of 733 t per day have also been established [Shenoi 1993; Men 1993]. These federations have forged strong links with the extension wings of the ICAR and state agriculture departments to provide the farmer members of the co-operative societies the best available technology and inputs. Recent studies indicate that farmers participating in such co-operatives have benefited by earning an additional income of Rs 30 to 50 per quintal of oilseeds sold [Shah and Modak 1986]. The NDDB has also been trying to stabilise supplies and prices through its market intervention operations (MIO), as mentioned earlier. This is sought to be done by building up an adequate buffer stock of edible oils from both imports and domestic sources so as to enable the NDDB to intervene in the wholesale oilseeds/oil market by releasing stocks or engage in procurement operations when the prices of groundnut and mustard oil went outside their prescribed price band. A market intervention fund of Rs 30 crore was to be raised by the NDDB to meet possible losses from MIO. As soon as the fund, including interest reached this target, any surpluses generated by the NDDB from its MIO would accrue to the government. Losses which cannot be met from the MIF are to be reimbursed by the government. To enable the NDDB to fulfil its tasks under the MIO, a special line of credit has been provided to it, from the RBI and NABARD for stocking of oilseeds and oils for the MIO, similar to the line of credit provided to the Food Corporation of India to procure and stock foodgrains. The NDDB has, however, met with only limited success in its MIO. Though it had been able to contain the intra-year variations of groundnut and mustard oil, the two most important edible oils consumed in India, within the prescribed

price bands in the initial two or three years, during 1992-93 prices of edible oils soared to dizzy heights. NDDB's inability to build up an adequate buffer stock of edible oils, partly due to the drastic cut in imports of edible oils, apart from bullish sentiments in the market and restrictions imposed on free movement of edible oils to other states by the Gujarat government, constrained its efforts to intervene in the wholesale market of oilseeds/edible oils. According to a press report, in the initial two or three years when the NDDB's MIO was in operation, despite monsoon failures and other factors, the NDDB was able to contain the price fluctuations since the trade was not aware of the stocks held by the NDDB available for use in their intervention operations. However, during 1993 the stocks held by the NDDB and constraints imposed on the NDDB by the government of India regarding quantum and timing of its purchases under MIO were all leaked out by a leading economic daily. This enabled speculative traders to operate freely and with full knowledge of the activities of NDDB, which made the task of controlling prices difficult. The same news report also suggested that the NDDB and government incurred a loss of over Rs 250 crore or so as a result of the MIO (*Deccan Herald Supplement*, Bangalore, September 21, 1993, p.1). Without an adequate buffer stock of edible oils and storage capacity it will be difficult for NDDB to make an effective presence in the market. The NDDB has already set up oil storage capacity for 1 lakh t at Delhi and another 40 thousand t at Kandla. The government has also reaffirmed its commitment to enable the NDDB to build up a buffer stock of 1.5 lakh t of edible oils as envisaged when the MIO was proposed. Notwithstanding the above, according to another report, the NDDB's MIO enabled groundnut and mustard farmers to realise an additional income of Rs 2,300 crore in 1990-91 (Men 1993). The NDDB has also been trying to influence the consumer market for edible oils by marketing edible oils under the brand name 'Dhara'. Within the short span of four years the Dhara oil has made its strong presence in the retail market and is most sought after by consumers. Sales of Dhara oil rose from a modest 1,187 t during 1988-89 to over 1.13 lakh t during 1991-92. Dhara oils' consistent quality, attractive prices, innovative packaging and good distribution network account for its growing popularity. The NDDB has also been trying to develop a single market for vegetable oils in India, by blending most preferred oils with refined oils and the wide consumer acceptability of its products attests to the success of this programme. In assessing the impact of the NDDB on the oilseeds and vegetable oils market in India, one must not lose sight of the fact that the NDDB has been operating in a hostile environment with the trade, industry

and import lobbies who were used to making huge profits in the past, colluding to make the NDDB's efforts to stabilise supplies and control prices a failure.

Another area which has been receiving special attention and emphasis is the modernisation of the processing sector. This is one of the thrust areas and mini-missions of the TMO as also that of the NDDB. The Indian oilseeds processing industry is widely scattered and segmented. They differ widely in respect of the levels of technology, capital and labour employed, size of operations and capacity, levels of efficiency, etc. From the traditional village 'ghanis' which are operated manually, animal or power-driven, to the expeller units of varying sizes and technology, and solvent extraction plants, to the modern large-scale refining and vanaspati factories, the Indian processing industry displays great diversity and features which are perhaps unique to India. Processing involves both primary and secondary stages to derive the final products which are oil, oilcake, oilmeal, etc., which find wide use and applications in the household and manufacturing sectors. While edible oils are used as a cooking medium and as an input in food-based industries, inedible oils are used to produce technical grade oils for use in the manufacture of soaps, paints, varnishes, etc., whereas oilcakes and meals are used as cattlefeed or an ingredient in cattle or animal feeds and also as a manure. The traditional village ghanis account for a relatively high proportion of the Indian oilseed processing industry. There were more than 25,000 village ghanis all over India during 1988-89 that were working and financed by the Khadi and Village Industries Commission (KVIC), government of India. As per the Livestock Census 1977, there were about 94,000 ghanis in the country. The ghanis seem to be relatively more inefficient as compared to the power mills or modern expeller units in that the oil yield obtained from seeds when crushed in ghanis is relatively lower as compared to that obtained from seeds crushed in power mills or modern expeller units and also the oilcake has a relatively higher oil content. However, both the ghani-produced oil with its distinct flavour and taste and oilcake with high oil content used as a cattlefeed or manure commands a premium in the retail market. There are, therefore, apparent trade-offs between efficiency and consumer acceptability which favour the traditional village ghanis. Moreover, in the context of promoting balanced regional or local-level development, generation of employment opportunities in rural areas, promotion of village industries, etc., ghanis need to be encouraged. According to a KVIC document oil ghanis under the KVIC fold produced oil worth Rs 242 crore during 1986-87 [KVIC 1990]. Its sales rose from Rs 8.7 crore in 1955-56 to Rs 258 crore

during 1986-87. The KVIC oil ghani units provided full time employment to over 40 thousand workers and another 36 thousand workers on a part-time basis during 1986-87. Efforts are on to develop improved ghanis that are more efficient and cost-effective. The KVIC has improved upon the Wardha ghani and developed improved ghanis such as the improved Kallupati, Warangal and Nutan ghanis which incorporate technical improvements over earlier ghanis. The KVIC document further notes that the overhead power-driven improved ghanis takes more capacity per charge, 12 to 15 kg as against only 6 to 10 kg in the case of the improved bullock-driven ghani. It also requires less crushing time per charge, 60 minutes for groundnut, sesamum, and 90 minutes for mustard as against 90 and 150 minutes respectively in the case of the bullock-driven improved ghanis. The cost on motive power for crushing sesamum (til) is Rs 5.5 per quintal in the case of overhead power-driven improved ghani as against Rs 12.50 for improved bullock-driven ghanis. The floor space requirement is also 80 sq ft for the improved power-driven ghanis as against 400 sq ft for the bullock-driven ghani. Research by the CSIR and other agencies are also in progress to develop improved ghanis and expellers. An improved small expeller designed and fabricated at Merado, Ludhiana improves over the technical constraints of traditional expellers and also extracts more oil. In the case of large expeller units an improvement in operation by switching over to a two-step expelling operation will reduce energy consumption per ton of seed crushed and yield more oil (i.e., about 34 kg of additional oil per ton of seed with 40 per cent oil). In the case of the village ghanis emphasis in research ought to focus on developing energy-efficient and cost-effective ghanis rather than increasing the oil yield from seed and oilcakes in view of the consumer preference and premium for ghani-produced oils and oilcake. In the case of expeller and other large units in addition to energy-efficient and cost-effective technologies research should also focus on improving the oil yield from oilseed, oilcake, etc. Inefficiencies in the Indian oilseeds processing industry are estimated to result in a loss of 5 lakh t of oil annually. This needs to be reduced by developing and popularising improved oilseeds processing units. In addition to the NDDB, the National Co-operative Development Corporation (NCDC) is also involved in developing and modernising India's oilseeds processing sector. As of 1988-89, the NCDC has sanctioned assistance to the tune of Rs 330.22 crore for setting up 132 oilseed processing units in the co-operative sector. The Indian oilseeds processing industry has excess capacity to the tune of 40 to

50 per cent. While there is seemingly no need for any additional capacity to cope with the envisaged increase in domestic production of oilseeds, there is clearly a need for modernising the processing sector to eliminate wastages and make it more competitive.

Apart from the constraints mentioned above, there is another factor which may come in the way of harmonious development of the oilseeds and vegetable oils sector. This is that several agencies are involved and concerned with the oilseeds and vegetable oils sector. Oilseeds production programme is under the aegis of the ministry of agriculture, government of India and the state agricultural departments; research under the Indian Council of Agricultural Research; price and market support interventions by the NAFED and NDDB; public distribution by the department of civil supplies; processing technology by the CSIR; and imports are handled by the State Trading Corporation. Often they would work without co-ordination or at cross purposes. The TMO has, in a way, been trying to play the role of an overall co-ordinator though there is much more that needs to be done in this area.

India's quest for self-sufficiency in edible oils, however, has attracted criticism in certain quarters. Since Indian oilseed and edible oil prices have ruled higher than world prices for several years in the recent past and also since the Indian oilseeds sector is observed to be net subsidised as per the findings of one study it is argued that on grounds of economic efficiency and comparative advantage it would be advantageous for India to concentrate on production of commodities such as rice, cotton in which it is internationally competitive, export them and use the foreign exchange so earned to import edible oils [Cf. Gulati 1990]. Gulati's study tried to estimate the degree of protection enjoyed by the Indian oilseeds sector and used three incentive indicators or types of protection coefficients: (i) nominal protection coefficient (NPC) – i.e., ratio of domestic to world reference price of the commodity under consideration, (ii) effective protective coefficient (EPC) – i.e., ratio of value added at domestic prices to value added at world reference prices, and (iii) effective subsidy coefficient (ESC) – i.e., ratio of value added at domestic prices inclusive of net subsidies on tradable inputs to value added at world reference prices. Using these three types of protection indicators, Gulati's study notes that in the case of all the oilseeds and states under review, i.e., groundnut in Gujarat, rapeseed-mustard in Uttar Pradesh, soyabean in Madhya Pradesh, and sunflower seed in Maharashtra, during the period 1980-81 to 1986-87, the NPCs, EPCs and ESCs were all above unity. The

FSCs for groundnut and rapeseed-mustard which were 1.59 and 1.61 over the period 1980-81 to 1986-87 were much higher than the same for other commodities like wheat (0.93), rice (0.88) and cotton (0.75) [Gulati 1990]. This comparison of Indian domestic oilseed prices including subsidies with world reference prices, to adjudge the degree of protection enjoyed by the Indian oilseeds sector is not without flaws. For instance, it is well known that farmers, including oilseed growers in the US and Europe receive large direct and indirect subsidies. Any comparison of the degree of protection enjoyed by Indian oilseeds growers *vis-à-vis* the rest of the world would be incomplete and give a distorted picture if it takes note of the subsidies enjoyed by the Indian oilseeds growers but ignores to take into account the huge subsidies enjoyed by the US and European oilseeds growers in its analysis. The world reference price, therefore, appears to be an inappropriate yardstick for comparison, unless it is adjusted to account for the large subsidies given to the US and European oilseed growers (USA and the European Economic Community (EEC)). It may be noted, are major players in the international trade of oilseeds/vegetable oils. It has been noted that the support prices paid to the Indian groundnut and mustard growers are less than the support prices paid to the groundnut and mustard growers in the US and Europe [Shenoi 1993]. Aggregative or macro-level studies often tend to hide several micro-level or ground realities. In Gujarat, for instance, the crops that mainly compete for area with groundnut are bajra, jowar and cotton. During the period 1954-55 to 1981-82, the ratio of groundnut yield to that of jowar and cotton yields were greater than unity [Ninan 1989]. In relation to bajra it was slightly less than unity during 1979-80 to 1981-82. However, for the 27-year period reviewed, except in 9 years, the ratio of groundnut yield to bajra yield had been greater than unity. Groundnut, therefore, continues to hold an edge over its competing crops in terms of yields in Gujarat. The prices of groundnut relative to those of bajra, jowar and cotton too had increased significantly during this period [Ninan 1989]. The ratio of gross income (i.e. yield valued at farm harvest price) from groundnut to bajra is around 2, and over 3 in relation to both jowar and cotton [Ninan 1989]. Another study notes that groundnut yielded slightly less profits over paid out costs (i.e. Rs 1,844 per ha) as compared to bajra (Rs 1,927 per ha) in Gujarat [Gulati 1990]. The same study also notes that the rate of profitability (i.e. rate of profit over paid out costs) was the highest (119.84 per cent) for jowar, followed by bajra (105.43 per cent), groundnut (70.58 per cent) and lowest in cotton (68.63 per cent). Both

bajra and jowar are low value subsistence crops with a limited market and even despite their relatively higher rate of profitability compared to groundnut and cotton in Gujarat, farmers may still prefer to grow groundnut which is a cash crop with an assured and growing market. Cotton, the alternate cash crop, as the above analysis reveals is less profitable than groundnut in Gujarat. Thus groundnut enjoys a comparative advantage over its competing crops on various considerations in Gujarat. In Andhra Pradesh which has displaced Gujarat to emerge as the largest groundnut-producing state in the country, groundnut yielded more profits over paid out costs (i.e. Rs 1,239 per ha) as compared to its competing crops, jowar (Rs 426 per ha), moong (Rs 745 per ha) and urad (Rs 1,187 per ha) during the 1980s [Gulati 1990]. In Orissa too where groundnut area and production have been appreciating fast, groundnut yielded the maximum profits over paid costs (Rs 3,620 per ha) as compared to moong (Rs 1,096 per ha) and paddy (Rs 2,025 per ha), its competing crops [Gulati 1990]. Take also the case of rapeseed-mustard which is the next most important oilseed grown in India after groundnut. In Rajasthan where increase in rapeseed-mustard area and production has been the most as compared to other states, the main competing crops for area are wheat, barley, gram and other rabi pulses. During the period 1954-55 to 1981-82, particularly the post-green revolution period, movements in relative prices, yields and gross incomes have, by and large, been favourable to rapeseed-mustard in Rajasthan [Ninan 1989]. Profits over paid out cost during 1983-84 for rapeseed-mustard ranged between Rs 2,000 and 3,000 per ha in Rajasthan, Uttar Pradesh and Assam [Shenoi 1989]. Thus, it is clear that groundnut and rapeseed-mustard, our two most important oilseeds have an edge over their competing crops in different states. However, the limitations of a strategy which relies on the price mechanism for boosting oilseeds output and the need for a technology-induced growth in the long run have been emphasised earlier. There are other considerations also to justify India's quest for realising self-sufficiency in its requirements of oilseeds and vegetable oils. Given the bad experience with food aid (with strings attached) it is necessary for India to be self-reliant in an essential commodity like edible oils. The halting of food shipments to India during the Vietnam war and of wheat exports to the erstwhile Soviet Union by the US government are events that should not be overlooked. When agriculture even in the developed countries such as in the US, Europe and Japan are being heavily protected it is difficult to understand why Indian agriculture is being singled out for criticism on account of the various

incentives and subsidies extended for its growth and development.

The target of 26 million t of oilseeds production set by our planners for being attained by the year 2000 is not beyond reach if the present tempo of growth in oilseeds production at over 6 per cent per annum realised during the last five years or so (i.e. 1988 to 1992) is maintained. The strategy for boosting India's oilseeds output should, among others, lay emphasis on a regional approach to increasing oilseeds production keeping in view the regional diversities in the trends and patterns of growth of different oilseeds, on both technological and price factors and also through diversification of India's oilseeds economy by encouraging production of different oilseeds and varieties including traditional and non-traditional oilseeds/oil-bearing crops as also extending its cultivation in non-traditional areas. This will also help in stabilising our domestic supply of oilseeds and also cope with unforeseen eventualities. Apart from the major oilseeds, there are several crop by-products such as that of rice and cotton as also several oleaginous species of tree/forest origin which if properly exploited could meet a considerable part of our requirements of oilseeds and vegetable oils. If India fully exploits the potential of rice-bran and cottonseed it would be possible to generate an additional 1 million t of oil [Rao 1987, *vide* Ninan 1989]. However, due to technical and economic constraints it has not been able to fully exploit the potential of these sources of vegetable oil supply. The oils in the rice bran tend to get decomposed by active enzymes in the bran if the latter are not destroyed through the process known as stabilisation. This process of stabilisation needs to be undertaken immediately after processing rice in rice mills. The Indian rice mill industry, however, needs to be modernised to facilitate this process of stabilisation if rice bran is to emerge as a major source of our vegetable oils supply. In the case of cottonseed, apart from the technical problems in extracting the oil from the seed, it is preferred as a cattlefeed and unless suitable alternatives for cattlefeed are found, it would be difficult to expect cottonseed to contribute to a major share of our requirements of vegetable oils. The potential oil from seeds of tree/forest origin is placed at about 1 million t [National Commission of Agriculture, 1976 *vide*, Ninan 1989]. However, the TMO and the Indian Council of Agricultural Research has put this potential at a higher figure, i.e. at about 2 million t of oil. Production of solvent extracted oil could also be stepped up to 0.35 million t [*vide* Ninan 1989]. Coconut is another important source of edible oils in India. However, productivity of coconut has been declining due to root-wilt disease. The annual loss in coconut production due

to root-wilt disease is estimated at 1,000 million nuts. Almost a fifth of Kerala's coconut palms are reported to be affected by root-wilt disease. Replantation of diseased coconut trees needs to be given priority in the drive for self-sufficiency in edible oils. By exploiting the potential of maize germ and other crop by-products, it should be possible to produce a few more lakhs of vegetable oils. Oil-palm, if popularised, could be another important source of edible oil, as suggested in an earlier study [Ninan 1989]. Its per ha oil yield is the highest (over 5,000 kg) as compared to other crops like coconut (615 kg), sunflower (275 kg), groundnut (201 kg) rapeseed-mustard (161 kg), soyabean (120 kg) and sesamum 82 kg [Meenakshi 1986 vide, Ninan 1989]. It is a capital-intensive crop and suited only for large-scale production under corporate or co-operative management. An advantage is that it is not a seasonal crop but is produced all-round the year and is also singularly free from pests and diseases. It gives a steady stream of income spanning over 30 years after an initial gestation period of five to seven years. Areas to the extent of 7.96 lakh ha have been identified in Kerala, the Andaman-Nicobar Islands, Karnataka, Andhra Pradesh and other states suitable for growing oil-palm. Under the Eighth Five-Year Plan, 80,000 ha was proposed to be brought under oil palm cultivation. If oil palm cultivation hopefully catches up, India could be self-reliant in the oilseeds sector as also be in a position to stabilise its domestic supply of vegetable oils.

In the context of the changing global and domestic policy environment and the process of economic reforms initiated in India since 1990 with its emphasis on market liberalisation and globalisation as also a reduction in the role of the state and public expenditures it would not be out of place to mention a word or two regarding the possible implications of these policy changes on India's agricultural economy in general and on the oilseeds sector in particular. Though a reduction in government budgetary deficits and public expenditures is one of the avowed objectives of the structural reforms in India, evidences suggest that if agricultural growth in India is to be accelerated and sustained, if private investment in agriculture is also to be stepped up, then public investment in agriculture itself needs to be stepped up [Ninan 1994]. Though the GATT agreement on the Dunkel Draft envisages an increase in global trade through a reduction in tariff and non-tariff barriers and also a reduction in subsidies, according to the government of India, this will not affect the present level of subsidies for Indian agriculture since it is well within the prescribed limit as imposed by the GATT agreement on the Dunkel Draft. It is also

reported that once the GATT agreement comes into effect procurement of agricultural commodities will have to be made at market prices. However, we have already noted that in the case of oilseeds, market prices have ruled higher than support prices. To that extent the various incentives and institutional support extended to the oilseed sector may be unaffected or have only minimal impact. In fact if subsidies to agriculture which are very high in the developed countries are to be reduced in consonance with the limits stipulated by the Dunkel Draft international oilseed/oil prices may go up. If India were to meet its requirements of oilseeds/vegetable oils through substantial imports rather than through increased domestic supplies, it may have to pay more hereafter. This will aggravate further our BOP position. Even if India were to concentrate on production of crops like rice and cotton for export purposes in which India is stated to have a comparative advantage, there is no guarantee that our export earnings will go up considerably. The experience of many African countries, which concentrated on export crops in the process of structural adjustment, found to their consternation that despite their comparative advantage and increase in production of export crops, export earnings actually fell due to a recession in the global market [Ninan 1994]. For instance, Ghana raised production of cocoa considerably but due to a glut in the world market Ghanaian export earnings from cocoa declined. If global trade opens up India could of course take advantage of this by encouraging exports of agricultural and other commodities in which it has a comparative advantage. There are also possibilities of stepping up further exports of HPS groundnut, and of oilcake and meal in which we have a comparative advantage and for which there is a ready and growing market. In the context of a greater role being assigned to the private sector in the economic development of the country it would be interesting to note that big corporate bodies such as the Indian Tobacco Company (ITC) and the Hindustan Lever Company have been quite active recently in the Indian oilseeds processing sector. It is reported that due to the special support given by the ITC group of companies to farmers growing sunflower in Andhra Pradesh and Karnataka, sunflower output has increased by about 200 per cent in the last seven years ending 1992-93 [Shenoi 1993]. Other implications of the Dunkel Draft on Indian agriculture and the oilseeds sector in particular, especially Trade-Related Intellectual Property Rights (TRIPS) and patent rights need to be looked into. The expansion of production of non-traditional oilseeds and oil-yielding crops like sunflower, oil palm relies on use of imported varieties for research and development and the implications of the

GATT agreement on this need to be assessed, India which has also emerged as one of the world's largest producers of milk and milk products can also tap this sector for its requirements of oils and fats. In conclusion, India's quest for self-reliance in the oilseeds and vegetable oils sector is not beyond reach particularly in view of the strides and acceleration in growth achieved in the last few years primarily due to the efforts of the TMO, NDDB and other agencies concerned with the oilseeds sector.

[This paper is part of a larger study on 'Factors Causing Fluctuations in Groundnut Output in India', prepared by the author. The author wishes to thank P V Shenoi and other participants of a seminar at ISEC, Bangalore and also to V Rajagopalan and G N Rao for their helpful comments on the larger study.]

Environment and Sustainable Agricultural Development

Conflicts and Contradictions

V Ratna Reddy

Sustainable agriculture involves not only the identification and application of improved technologies but the incorporation of ecological and socio-economic considerations. Inevitably conflicts and contradictions arise. This article focuses on the inherent conflicts and contradictions which come in the way of operationalising the concept of sustainable development in the context of Indian agriculture.

I

Introduction

THE concept of sustainable development came into prominence in 1980 and evolved itself as one of the mainstream developmental paradigms by late 1980s. In the process it has undergone numerous changes in its definition and objectives. However, the most popular definition so far has been the one adopted by the World Commission on Environment and Development [WCED]. According to this definition "Sustainable development is development that meets the needs of present without compromising the ability of future generations to meet their own needs" [WCED 1987].

In the overall debate on sustainable development agricultural sector is often at the centre of discussions due to the obvious environmental problems associated with farming activities apart from being the dominant sector in the developing countries which are in the centre of controversies related to environment. It is now recognised that sustainable agricultural production not only involves identification and application of improved technologies but also ecological and socio-economic concerns [Pookpakdi 1993]. According to Food and Agricultural Organisation [FAO] sustainable agriculture has been defined as: "The management and conservation of the resource base and the orientation of technological and institutional changes in such a manner as to ensure the attainment and continued satisfaction of human needs for present and future generations. Such sustainable development is environmentally non-degrading, technically appropriate, economically viable and socially acceptable" [FAO 1991].

The definitional objectives of sustainable agricultural development appear to be of a tall order. Broadly, these objectives can be grouped under four properties of agro-eco-systems - productivity (measured in terms of yield or net income or food value, etc), stability (measured as coefficient of variation of yield or net income), sustainability (difficult to measure in quantity terms) and equitability (in terms of income distribution) [Conway et al 1987]. However, these properties cannot be maintained at an equal

scale and a trade off does take place between these in order to achieve the objectives. One has to forego productivity or/and stability in order to achieve sustainability and equitability and *vice versa*. In the wake of population explosion and food security the green revolution technologies appeared to be the answer but they are associated with low sustainability and low/medium equitability [Red Clift 1992]. Conway argues that the ideal solution lies in improving equitability at the cost of sacrificing some of the productivity associated with green revolution technologies [Conway 1985 as quoted by Red Clift 1992]. But, this solution fails to tackle the short run food requirement in the developing world. Even if food requirements are taken care of (externally through imports) sacrificing productivity does not come easily without interventions in social dynamics. For instance, though the grass roots level adoptability of the low-input sustainable agricultural technologies largely depends on the economics of technology, all the objectives of sustainability cannot be achieved simultaneously as a rule and hence trade-offs are inescapable [Tisdell 1988].

In this regard, perceptions and attitudes of the people towards environment and sustainability play a vital role. It may be noted here that the increases in agricultural production in the green revolution regions have occurred through a nine-fold increase in fertiliser consumption, with reducing marginal gains, and at the cost of significant soil salinisation and pollution. Nevertheless, it is being recommended that "many countries should increase yields by greater use of chemical fertilisers and pesticides, [although] countries can also improve yields by helping farmers use organic nutrients more efficiently" [WCED 1987, as quoted in Lele 1991].

These contradictions and conflicts arise mainly due to the fact that the debate on environment and sustainable development hitherto has been based on either dominant social paradigm or a deep ecology paradigm. Often development and ecological concerns are viewed as conflicting goals. The attempts to integrate these two views have not been very successful as they failed to incorporate the socio-ecological aspects into the concept

of sustainability [see for example Chambers 1987; Jain 1988; Jodha 1991]. Besides social dynamics, agrarian structure, technologies, etc, are not given due consideration in the debate on sustainable agricultural development though the role of markets is well recognised, especially by economists. The issues that need further discussion, in this context, include (i) awareness and attitudes of the people at the grass roots level towards environment and sustainability specifically with regard to inter-generational equity, (ii) sustainability within agriculturally developed (green revolution) regions *vis-a-vis* fragile resource regions, and (iii) role of technology and its relevance in working towards environmental protection and sustainable agriculture.

This paper attempts to bring to the fore some of the inherent conflicts and contradictions that come in the way of operationalising the concept of sustainable development in the context of Indian agriculture. Further, it tries to focus on some of the vital aspects or links that are missing in the whole debate and are important to achieve the objective of sustainability. This paper is organised on the lines of four properties of sustainable agro-eco systems suggested by Conway. Accordingly, the paper is divided into five sections - the three sections that follow deal with the aspects of productivity and stability, sustainability and equitability respectively, while some concluding remarks are made in the final section.

II

Productivity and Stability

Though environmental protection/sustainability of agriculture and economic development are compatible on a theoretical plain, in practice a trade-off exists between them. This is more so in the context of developing countries which are predominantly agricultural economies and are presently striving to achieve high growth rates in order to attain basic standards of living. In the late 1960s and early 1970s when the food security was under threat India launched the HYV chemical fertiliser centred technology in a big way (high

productivity). Input subsidies were instituted to ensure rapid acceptance of this technology. Though this high input-intensive technology has helped in achieving the goal of enhanced food production, it has led to numerous environmental problems which became conspicuous by the early 1980s. Further, the complementary nature of these inputs with water has led to the concentration of this technology in well watered regions like Punjab, Haryana and other irrigated regions of the country. The major environmental problems of such an intensive agriculture include: degradation of soils due to inappropriate use of chemical fertilisers and mono-culture, degradation of groundwater quality, increase in use of pesticides leading to health hazards, deforestation and neglect of common property resources (CPRs) which further aggravated the problem of degraded soils, problems of pests and plant diseases which have remained uncontrollable (see Table 1). Besides, the soils which are not suitable for flood irrigation are having the problems of water logging and salinity. As a result, most of the green revolution regions have reached a plateau in productivity, and profitability of farming has started falling, though these regions still continue to be highly productive compared to other regions and hold the key for meeting future food demands [Vyas and Reddy 1993]. Moreover, the high productivities achieved in green revolution regions are observed to be unstable and fluctuating [for instance see Mahendradev 1987; Mitra 1990].

With the emphasis on pushing the new technology in the well endowed regions, which account for only one-third of the cropped area, the rainfed regions have remained largely neglected. This has resulted in aggravating regional inequalities in the country. Population explosion in these regions has further increased the pressure on natural resources like forests, mangroves, other CPRs, etc. Besides, the failure to realise the link between poverty and environmental sustenance has further aggravated the problem. In fact, it is argued that properly conceived poverty alleviation programmes could be a step in the direction of environmentally safe world [Vyas 1991]. All these factors, snowballed into major environmental problems like decline in forest cover, increased soil erosion, silting of reservoirs and lakes, decline in bio-diversity, etc [Vyas and Reddy 1993]. This, in turn results in declining productivity and stability.

Most of these problems arise mainly due to the politico-economic conditions existing in these countries which mostly result from the increasing demographic pressures. The development strategies pursued in these countries are a consequence rather than a cause of the population pressure and poverty. The link between development and poverty alleviation (even decline in fertility rates) portends the development dilemma. For, it

is argued that a five- to ten-fold increase in economic activity (growth required for poverty eradication) may impose an impossible burden on the eco-sphere. On the other hand, without significant reduction in poverty there is no way of controlling the depleting natural resources [Roumasset 1990]. Given the wide variations across the countries in terms of standards of living it is neither appropriate nor adequate to recommend a lower rate of growth. According to Sukhatmoy Chakravarty (1991), "... a recommendation to slow down the rate of GNP growth, despite all the limitations that attach to the concept, would go against the very spirit of sustainable development" [p 71].

Though the growth strategies pursued presently are proving to be environmentally costly, the costs seem to be less important when compared to the immediate concerns of meeting the basic needs given the socio-political conditions in the developing countries. The myopic attitude of the policy-makers arises from the difficulty they face in taking the perspective beyond the time-horizon of their tenure in office and in taking a national or international perspective beyond immediate concerns of their constituents [Miller 1990]. The politicians in the developing countries find it more prudent, given the political instability in most of these countries, to follow populist programmes, with visible short-term benefits, than in adopting sustainable and productivity-oriented programmes, whose benefits are less spectacular and future oriented. In other words, as long as employment and income generation problems rule higher on the political agenda, environmental concerns get only back seat in the developing countries [Reddy and Chiranjeevi 1993].

The nature of political system also does not seem to have any influence on this myopic nature of the policy-makers. For, the environmental degradation does not seem to be restricted to any particular political system, i.e., democratic, centrally planned, etc. As evident from the status of environment in eastern Europe and the erstwhile USSR and China (the centrally planned economies) cannot guarantee environmental protection [see for instance Stokke 1991 and Pearce and Warford 1993]. Similarly, the objectives of economic growth and employment are pursued with equal vigour, at the cost of ecology, in the democratic west with popular support [Stokke 1991].

The increasing concern for environmental problems at the policy-making level in the west are mainly due to the increased awareness among its citizens which is a result of high level of socio-economic development. On the other hand, in the LDCs the present concern for global environment and ecology is largely a result of the initiation and aggressive promotion by the industrialised western countries and some NGOs rather

than from the demands of its own populace. Apart from the international politics involved in promoting global environment, the considerable lag in development of the poor nations, puts them in a great dilemma as to whether to continue with their present route to development and fulfil the promised dreams of their people or to hastily change the definition of development as per the present-day notions of the people in rich countries [Reddy and Chiranjeevi 1993].

However, the overriding conflict between poverty and environment appears to be somewhat over emphasised. For, the level of environmental degradation appears to be universal irrespective of the level of poverty and economic development. The only difference is the nature of environmental degradation - in some regions (industrialised west) it is conspicuous in terms of industry and life style induced degradation in others (developing world) it is more in terms of natural resource depletion. These variations can be observed even within a country like India between fragile resource regions and well endowed regions. It is no denying fact that the environmental degradation is equally bad in the green revolution regions where the levels of poverty and unemployment are substantially lower. Similarly, the environmental problems are more serious in the case of erstwhile USSR and eastern Europe where state ensured at least the basic needs. However, the developed countries (with high living standards and low level of poverty and unemployment) are capable of taking preventive measures for safeguarding their environment in terms of mitigating technologies and also by promoting low productive agricultural technologies (low input intensive). On the other hand, developing countries cannot afford to go for these technologies as their priorities lie in meeting the basic requirements of their people. But, neither of the worlds is willing to change its life styles (the underlying assumption of the deep ecology paradigm) as the basic human psychology is the same everywhere.

As far as agricultural sustainability is concerned, climatic factors also play an important role. The threat to agricultural sustainability is more conspicuous in the countries (Asian and African) which are located in tropical regions where rainfall is capricious. Adding to this the population pressure is leading to extensive dependence on CPRs and the resulting land degradation. On the other hand, despite the fact that forests have virtually vanished in Europe the problems of degraded soils, natural vegetation and *in situ* moisture are on a lower scale due to the humid conditions and high rainfall. In these conditions the rejuvenation of natural resources is also easier. In other words, depletion of renewable resources in temperate zones is likely to have less adverse impact on human welfare when compared to tropical

zones [Pearce and Warford 1993]. But, the same may not be true in the context of humid regions in developing countries due to lack of alternative livelihoods (non-farm income, etc) and consequent interaction (over) with the eco-system.²

The role of technology in the process of sustainable agricultural development (in terms of enhanced productivity and stability) is often been sidelined in the entire debate. The contribution of Jodha (1991), in this context, stands unique though it mainly addresses the fragile resource regions. He tried to incorporate inter- and intra-generational aspects (population pressure) while defining the sustainability: "It is the ability of the system to maintain a certain well defined level of performance over time, and if required to enhance the same through linkages with other systems without damaging the ecological integrity of the system" [stress added, p A-15]. Deviating from the naive arguments that traditional technologies are more sustainable, he argues that they (traditional methods) are conducive for sustainable resource management under low pressure of demand in relatively isolated or inaccessible situations, but they are becoming increasingly unfeasible and ineffective in the context of rising pressure on fragile land resources [p A-22]. Further, he points out that "the indigenous systems, though oriented to resource use with conservation, do not possess high productivity technological components to ensure high use intensity and resource conservation simultaneously. The new science and technology-based interventions have capacity to raise use intensity and productivity of land but they are generally indifferent to conservation considerations. The above facts form the basic ground for blending the positive features of the two" [Jodha 1991 p A-22].

The need for appropriate technologies for sustainable agricultural development ought to be analysed from two angles. One is that the feasibility of the technologies, currently termed as sustainable, at the operational level and the other is regarding the relevance of high productive technologies (biotechnology, etc), now available or being developed, for sustainable agriculture. At present the technologies that are most talked about for agricultural sustainability are 'low input intensive agriculture', 'organic farming' or 'natural farming', etc. Research elsewhere suggests that the low input sustainable agriculture is less productive and less profitable compared to conventional technologies (i.e., high chemical fertiliser intensive) [see for instance Kikuchi 1993; Hsiao 1993; Dobbs 1993]. These practices are less profitable despite the fact that organically produced products get premium prices in the markets [Dobbs et al 1991 as quoted in Dobbs 1993]. Moreover, low input sustainable systems can be more risky for farmers than conventional systems, especially

during transition, specifically with regard to weed control [Dobbs 1993]. Similarly, it is observed in the case of azolla³ (a low input) technology in Philippines, constraints such as vulnerability to insect-pest and high labour requirements could easily undermine the sustainability of the technology [Kikuchi 1993]. In the Indian context also high labour costs coupled with long gestation periods are attributed to the non-adoption of organic farming practices [Down to Earth 1993]. Therefore, the feasibility of these farming practices depends on profitability at the farmers level. Unless economic incentives are provided, significant adoption will not be possible [Hsiao 1993]. This may be the reason why in a vast country like India we have only a handful of farmers to boast about in organic farming [the case of Shri Narayan Reddy near Bangalore seems to be the only case that is being quoted often in the past several years, see Nadkarni 1988; *Business India*, June 22-July 5, 1992; *Down to Earth* 1993].

In the prevailing conditions in developing countries, organic or low input intensive farming systems are not only unadaptable at the farmer level due to low profitability but also at the policy level consequent to the long gestation periods required for these systems to be as productive as the conventional systems. Moreover, this conflicts with other environmental aspects like afforestation. While ecological concerns require the conservation of forest lands, the low input sustainable agricultural technologies demand extensive cultivation practices (i.e., encroaching forests) in the light of increasing population pressure and the resulting food demands. This in turn gives rise to another conflict between tribals and environment. Given the goals of meeting food requirements and self-reliance in the developing world it is most unlikely that politicians would support the promotion of these systems in the near future. Moreover, recent research also raises doubts on the ecological sustainability of some of these systems. The ongoing experimental research on 'Paddy Cultivation and Global Warming' at the International Rice Research Institute, Philippines indicate that the increase in temperature (global warming) through paddy cultivation is substantially higher when organic manure is used compared to chemical fertilisers.⁴ Similar doubts are raised with regard to the health hazards (in terms of nitrates concentration in ground water) due to the use of chemical fertilisers *vis-a-vis* organic manure [Conway 1989, as quoted in Vidyasagar 1993].

On the other extreme, we have the technologies that are being used by Israeli farmers for the past 25 years. These technologies which use saline water and mostly operate under full human control are more productive and even sustainable (continuously increasing productivity levels during the past 25 years) when compared to the highly acknowledged conventional

technologies. During the past decade yield rates have gone up by nearly 20 times for tomato, water melon and other fruit and vegetable crops and, most importantly, they are competing in the international markets without much of government support [Moti Harare 1993].⁵ Similarly, bio-technology, when developed to its full extent, may be of vital importance for sustainable agriculture in terms of productivity, stability, and sustainability of the agro-systems as defined by Conway [for differing views and various aspects of biotechnology see Swaminathan 1992 and Ahmed 1992]. But the equity aspects, which are equally important for attaining agricultural sustainability may be left out by these technologies. Therefore, the potential for these technologies can be enhanced if the equity aspects are taken care of externally.

The preceding discussion brings out clearly that the conflicts and contradictions associated with productivity and stability aspects need to be addressed at the policy as well as technology levels. At present environmental concerns do not find place in policy planning due to the myopic attitude of the policy-makers towards solving the problems of poverty and unemployment. It is important to realise that poverty and employment are not solely responsible for the current environmental problems and long run solutions can be sought by following environmentally sustainable path. Incorporation of ecological aspects into policy planning would largely depend on the awareness and attitudes of the people towards environment. As far as technologies are concerned, development of economically viable and environmentally friendly technologies would go a long way in achieving the objectives of productivity and stability.

III Sustainability

Sustainable agriculture or sustainability has been defined and interpreted in a number of ways in the recent literature [see, for instance, Chapman and Barker 1991; Dixon and Reyes 1990; Pookpakdi 1993; Malik and Faeth 1993; Lele 1991; Ray 1993; Chopra 1993]. But, they fail to comprehend with the overall objectives of inter- and intra-generational equity. Even at the conceptual level it is difficult to circumvent the conflicts between the present and future generations' interests. While needs are conceived differently from one environment and culture to another in the same generation, how future generations will conceive of their needs may well be beyond our imagination, although calculations may be based on some fixed standards involving what at present are conceived of basic human needs [Stokke 1991]. The equivocal nature of the concept is believed to have hampered the direction

of policies of international agencies [Lele 1991].

As far as the sustainability aspect is concerned the debate on sustainable agricultural development has often sidelined the two important aspects, namely, (i) the long-run (inter-generational) *vis-a-vis* short-run (intra-generational) impact of sustainable agricultural development, and (ii) the inter-regional variations in the level and process of sustainability and thus missing on socio-ecological interactions. Though the writings of Chambers (1987) and Jodha (1991) clarify the first aspect to some extent, they fail to address the second issue as they restrict themselves to the problems of fragile resource regions.

Chambers (1987) argues that sustainable development can be achieved by securing livelihoods for the critical group of the very poor which would result in stabilising environment, enhancing productivity and establishing a dynamic equilibrium of populations and resources. According to him: "A solution is sought not through unproductive conservation but through development with a positive impact on livelihoods which, in turn, later become sustainable. Short-term improvements in living thus create conditions for later livelihood-intensive and sustainable human use of environment" [Chambers 1988, p 16]. These solutions hold good for the resource poor regions where majority of the population lives below the sustainable livelihood [SL] line. But, what happens once the critical populations cross the SL line? Do they still continue to safeguard the long run sustainability of the system because they know very well that their survival depends on the sustenance of the agro-system? Or do they act in the fashion akin to their counterparts in the endowed regions, e.g. over-exploitation and misuse of natural resources which is prevalent in the developed regions (green revolution belt). The experience indicates that they would go more in the way of their counterparts. In other words, once livelihoods are stabilised in terms of soil rejuvenation, groundwater replenishment, etc. people tend to over-exploit the natural system in order to reap the benefits in short run. A case in point is the experience of 'pani panchayat' in Maharashtra. Despite the dedicated involvement of a committed NGO some of the user groups of lift irrigation schemes are breaking away in pursuance of short run gains. These groups of users who came together to fight the drought and severe adverse environmental conditions could not only come out of the poverty trap but also achieve fairly good living standards [for details see Deshpande and Reddy 1990]. This was possible through watershed programmes, following low water intensive cropping patterns, judicious water management, etc. However, within a short span of five years individual farmers started

TABLE : STATUS AND PROCESS OF SUSTAINABLE AGRICULTURE

Fragile Resource Regions	Well Endowed Resource Regions
Physical Environment	
(a) Harsh climatic conditions	(a) Favourable climatic conditions
(b) Degraded soils and desertification	(b) High-intensive or non-organic input use
(c) Depleting natural resources like forests, groundwater and other common-property resources due to population pressure.	(c) High irrigation or cropping intensities
(d) Lack of vegetation and <i>in situ</i> -moisture	(d) Increasing waterlogging and salinity
(e) Low input intensity in agriculture production and limited protective irrigation facilities	(e) Declining soil fertility
	(f) Increasing health hazards
	(g) Depletion of natural resources like forests and other CPRs due to commercialisation of agriculture
Economic Environment	
(a) Subsistence agriculture (largely) and low value crops	(a) Commercial and high value mono-crop agriculture
(b) Low and stagnant or moderate growth rates in production	(b) High but stagnant/moderate growth in production
(c) High level of un/under-employment	(c) Multiple choices of income
(d) High dependence of non-market sources of income like forests and CPRs	(d) Improved product and factor markets with larger marketable surpluses
(e) Low resource base of the rural community	(e) Easier access to basic needs like drinking water, literacy, health, etc
(f) Product and factor market imperfections	(f) Fairly high levels of living standards
(g) Low marketable surplus and low profits	
(h) Larger efforts and expenditure in acquiring basic needs like drinking water, fuel-wood, etc	
(i) Low levels of living standards	
Social Environment	
(a) Low level of social consumption (literacy, health, sanitation, drinking water, etc.)	(a) Better political awareness and access to social consumption items
(b) Strong cultural values which are often linked to environmental factors	(b) Greater dependence on technology and hence lesser concern for environment
(c) General attitude is towards resource conservation mainly due to scarce conditions	(c) Highly commercial-mindedness and abuse of natural resources and often compete among themselves in exploiting the natural resources
(d) Low level of political awareness	(d) Priority for accumulation in the short run
(e) Priority for survival in the short run	
Policy Environment	
(a) Neglected and half hearted attempts of development	(a) Pampered by the policy-makers so far
(b) Lopsided development policies with inappropriate technologies, blanket policies, etc	(b) Policies are not conducive for natural resources conservation They are productivity-based rather than being sustainable
(c) Neglect of natural resource base and alienation of local institutions like participatory process, community management, etc. and local knowledge.	(c) Policy-makers fail to utilise the commercial attitude of the people for promoting sustainable policies due to political pressures and rent seeking nature
(d) Attitudes among policy-makers are not conducive to the evolution of strategies based on conservative-oriented technology, use of local and often, degraded resources and mobilisation of the people	
(e) However, of late, there is a realisation among policy-makers that development of these regions is crucial for sustained overall growth.	
Level and Process of Sustainability	
(a) Some of the regions are at the bottom of the sustainability curve	(a) These regions are located at all the 3 points, a, b and c on the sustainability curve. The downward trend has become conspicuous in the 1980s
(b) Some on the upward sloping portion of the SC	(b) The vital ingredients for sustainability in these regions are, generating awareness through formal education fostered with policies based on market valuation of natural resources. Aggressive market-oriented policies can be pursued without much adverse impact
(c) As the potential for dry land technology, and market environment is quite high in these regions; there is a possibility of sustained growth	
(d) Appropriate policies in terms of technologies and institutions are needed in order to sustain the upward climb of the SC curve along with generating awareness through formal education	

FIGURE: PATH OF AGRICULTURAL SUSTAINABILITY

breaking away despite strict rules in terms of water rights and started growing water intensive high value crops with the help of private wells - which are now possible because of improved groundwater levels in the region and income levels of the farmers.

Similarly, the environmental impact and sustainability question in the developed regions goes beyond attaining sustainable livelihoods. These regions are also facing severe environmental problems despite the fact that they have achieved higher and stabilised livelihoods. Also higher income levels are positively associated with environmental degradation even in poor countries like India [Rao 1994]. Therefore, the question arises whether the improved livelihood patterns are sustainable in the long run once people cross the SL line? This is a contradiction in the broader context of inter-generational equity of the sustainable development paradigm.

The status of various environments - physical, economic social and policy - prevalent in the two broad regions, i.e. fragile resource and well endowed regions, along with their level and process of sustainability is presented in the table. The major differences between these two regions, apart from resource endowments, include cultural values, dependence on natural eco-system. However, the environmental problems are more conspicuous in the fragile resource regions due to the harsh climatic conditions coupled with lack of protective irrigation. The rising population pressure has led to their increasing dependence on CPRs resulting in degraded lands, denuded forests and depleted groundwater tables. When the individual survival mechanisms are stretched to their limits people in a community try to come together in their struggle for existence in order to rejuvenate the agro-eco system [Deshpande and Reddy 1990]. One finds in fragile resource regions people's attitudes towards natural resources to be benign mainly arise out of their high dependency on them. For, lack of irrigation and farm technologies makes them more vulnerable with very less control on the agro-eco system, at least in the short run. However, once these regions, which have great potential for conservation oriented technology and harnessing local

resources judiciously [Rao 1991], are equipped with appropriate technologies and gain control over year to year climatic variations with protective irrigation, it is unlikely that they would strive for long run (inter-generational) sustainability. Therefore, the vital link between livelihood patterns and development on one hand and environment and sustainability on the other is the awareness and attitudes of the people. In fact, these two conditions are necessary even for making Conways' solution for sustainable development a feasible one. However, these two factors cannot be achieved easily and automatically should be fostered with other economic (markets and prices) and institutional factors (agrarian structure, etc) in order to make the policies towards sustainable development effective.

It appears, following the experience of well endowed regions and fragile resource regions, sustainability follows a cyclical pattern. There is a possibility of coexistence of two different situations, broadly, represented by fragile and endowed regions, where some regions (fragile resource regions in India presently) are on the rising portion (at point 'a') on the sustainability curve [SC] and others on the plateau portion (point 'b' in the figure) or on the downward sloping portion (point 'c') of the 'SC'. The 'SC' curve in the figure shows the relationship between level of development and level of sustainability. Sustainability of the system rises along with economic development (in terms of infrastructure, irrigation, etc) and then starts falling consequent to excessive extraction from the natural system. For instance, excess use of fertiliser and pesticides coupled with inefficient use of irrigation water is believed to have resulted in environmental degradation in some of the green revolution regions. This, in turn, has led to declining sustainability in terms of falling and unstable yields. On the other hand, the fragile resource regions, which are at the trough of the sustainability curve, are likely to move towards revival through state intervention (in terms of specific drought area and watershed programmes, etc). Besides, the extreme conditions in these regions also bring people together in their fight for survival, apart from attracting NGOs, to rejuvenate the natural system and improve the status of sustainability. The next cycle will take off in a similar fashion irrespective of the type of the region, i.e. well endowed or fragile resources. The efforts towards improving canal systems by state and people in some of the canal commands where sustainability of canal irrigation is being threatened, is an indicator in this direction.

The figure also indicates that agricultural sustainability moves cyclically between the boundary lines of 'b' and 'd' - 'b' represents the highest level of agro system's sustainability while 'd' represents the lowest level. Keeping the other things constant (in terms

of interventions for environmental protection) the cyclical pattern takes place due to the (lopsided) policies of the state which are biased towards well endowed regions in the beginning and later shifting towards fragile resource regions (this is the case with Indian agriculture). However, the course of the cycle can be altered if appropriate interventions are made either by state or NGOs (SC₁ in the figure).

People are often myopic about their environment especially when they are above line of sustainable livelihoods. Their attitude towards environment is not very dissimilar to that of their behaviour during times of inflation. However, awareness among the people with regard to environment may slow down this process to some extent. It is also important to recognise that the awareness generated through external forces like NGOs may not be sustainable and have limited influence given the gigantic nature of the problem. Therefore, there is a need for stressing the importance of formal literacy programmes and there are no short cuts for this. In this context, it may be quoted "While non-formal education is helpful in creating the ambience for literacy, it is no substitute for formal elementary education. The focus has to be on structural reorganisation and functional remodelling of the formal system of elementary education and linking it with development programmes" [Acharya 1994]. Further, environmental aspects should be made an integral part of this formal education. In fact, it was noted that environmental concerns are not given due attention even at higher education level in India presently [for details see Vyas and Reddy 1993].

In order to have effective impact the literacy programmes should be fostered with state policies with regard to market as well as non-market interventions. The market interventions include pricing policies, policies on subsidies, etc. Unless pricing policies reflect the environmental concerns, it is difficult to change people's attitude towards environment. These policies can no longer wait, as we continue to adopt environmentally costly growth pattern just because some of the costs cannot be quantified precisely at present [Nadkarni 1993]. At the institutional level, the interventions are equally important in removing the distortions in land, labour and capital markets. For, agrarian structure and factor market distortions are observed to be the root causes of unsustainable development [Vyas 1991 and 1993a].

IV Equitability

The equity issues are often found conflicting with the development strategies and never been in built with the policies or technologies in India, be it green revolution technologies or new economic policies. This is more so because of the existing agrarian

structure than to the technologies. The failure of development strategies to take care of equity issues reflect the insularity of our development planning. In order to take care of the equity issues one has to tackle the distortions in agrarian structure first. The link between land, labour and capital market distortions on one hand and the equity issues imbedded in the concept of sustainable agriculture makes it unavoidable to attain the goals of sustainable development without correcting these distortions. This is true even in the case of low input sustainable agricultural technologies and watershed based technologies. For, the fairly long gestational periods (7-10 years) these technologies require puts the small and marginal farmers at a disadvantageous position as their capacity to wait is substantially lower when compared to large farmers. Therefore, given the present agrarian structure these technologies also require external interventions in order to achieve the equitability objective. However, little attention is paid to the issue of agrarian structure in the overall context of sustainable agricultural development [see Vyas 1991 and 1993]. In the light of new economic policies it is apprehended that small farmers may become inviable as the market-centred system may not be effective in addressing their needs. The state should provide safety nets for these sections in the initial stages of liberalisation process and try to integrate them with the market in the long run [Vyas 1993]. In this context it may be noted that market-oriented agricultural production systems are effective in utilising scientific research for enhancing economic performance and curb environmental damage [Paz 1992].

Even in the light of new economic policies small farm systems may prove economically viable and ecologically sustainable provided the existing distortions in the agrarian structure are removed. Unless production systems serve the needs of small farmers and landless they would not be sustainable even in the short run. Moreover, the equity aspects perceived in this fashion (agrarian structure changes) would go a long way in addressing the broader issues of unemployment and poverty. Thus, the role of agrarian structure remains paramount in addressing the equity aspects of sustainable development.

V

Conclusions

Though the paradigm of sustainable development is riddled with contradictions and conflicts at the conceptual as well as operational level the much propagated conflict between economic development and environmental concerns seems to be less important in the light of socio-ecological attributes like awareness and attitudes. These characteristics are more crucial in the context of agricultural sustainability in India which

is known for its inter- and intra-regional and cultural variations. Lack of a comprehensive or integrated understanding of these aspects both at the conceptual and operational levels makes the question of agricultural sustainability ambiguous.

This paper argues that the models of sustainable development (e.g. agricultural) which focus on the people as their primary concern, should not stop at providing them with livelihoods alone. The problems of environment and sustainable agriculture are not limited to fragile resource regions or poor regions though the nature and degree of problems may vary between agriculturally developed and backward regions. Unless people's awareness, attitudes and perceptions towards environment are changed, sustainable agricultural practices as conceived in the present form, appear to be a distant dream.

The conservationist approach, which is being propagated presently, does not seem to appeal much at the operational level irrespective of the level of development. Similarly, focusing on the path of economic development is not of much help in addressing the environmental concerns. Though this seems to be the case with the now industrialised world, the developmental path may not be sustainable (economically as well as environmentally due to the linkages) any longer even at the present rate of natural resource depletion.

The main factors that may be instrumental in changing the perceptions of the people towards environment and achieving the objectives of sustainable agricultural development are (a) literacy, (b) market forces, (c) technologies, and (d) institutional changes in terms of agrarian reforms. Achieving full literacy would go a long way in bringing awareness with regard to environment and other aspects which are linked with it. Needless to say, conscious and concerted efforts should be made to incorporate environmental concerns into formal education. This in turn helps in influencing the perceptions of political leaders and policy-makers. Unless initiatives come from within the system, environmental programmes promoted by donor agencies and some NGO groups may not be sustainable and remain superfluous. Therefore, human resource development should take the centre stage in the development planning with concentration on primary education, health, etc. Integrating environmental concerns with market forces would help to bring in the required attitudinal change among the populace towards environment. Unless resources are valued/priced according to their real scarcity value, it would be unrealistic to think that individual rationality would go beyond households, let alone societies and nations. In this context, we need to re-examine our economic policies and follow relevant procedures so that pricing policies take the

environmental factors into account, national accounts reflect the depletion or destruction of natural resources, decision rules evaluating future costs and benefits more thoroughly, investment criteria incorporating the loss due to the depletion of national capital, etc [Postal 1992].

Another potential area that needs more concentration is the development of environment friendly and economically viable technologies. The available technologies at present seem to be missing on either productivity aspects (organic farming, etc), or equity aspects (biotechnology). While the former are unacceptable in the developing countries where meeting basic needs is on top of the agenda, the latter is against the basic aspirations of the sustainability concept itself. However, the later technologies can be altered and operationalised with the help of the required institutional changes. For, the inequities in the distribution of gains are attributed mainly to the existing agrarian structure, imperfect labour and capital markets. Unless these distortions are corrected equity cannot be addressed effectively under any circumstances be it new technologies or strategies. Besides, the equity issues are directly related with people's awareness (education) which would bring the equity considerations into fore in development planning. Therefore, to recapitulate, human resource development should occupy the centre stage in the overall developmental planning in order to achieve the objectives of sustainable agricultural development. And this should be fostered by state policies like integrating environmental concerns with markets, promoting efforts towards developing appropriate technologies which are sustainable economically as well as environmentally and removing imperfections in the agrarian structure – i.e. land, labour and capital markets.

Notes

[This is a revised version of the paper presented at seminar on Environment and Economics organised by Centre for Science and Environment, New Delhi, January 26-28, 1994. Thanks are due to V S Vyas, M V Nadkarni, Iqbal Narain, M S Rathore and T Churanjevi for their valuable comments on the earlier drafts of the paper. However, the usual disclaimers apply.]

- 1 However, our discussions with the farmers in one of the high pesticide-intensive regions of the country, Guntur district of Andhra Pradesh, revealed that the uncontrollability of pests in recent years is more due to the declining quality of the pesticides rather than due to pests growing immune to pesticides (which the farmers reluctantly accept).
- 2 For, the environmental problems of the humid mountain tracks of India are equally strident which may be due to the high dependence of the local people on the natural system [see for details Jodha et al 1992].
- 3 Azolla is an aquatic fern that has an ability of fixing molecular nitrogen with symbiotic blue-green alga. It is being used as green manure

in southern China and northern Vietnam. Once azolla is inoculated to wet paddy field, it propagates fast without any input, or with additional phosphorous fertiliser for P deficient paddy soil. Its ability to fix N is as high as some N fixing legumes; 1-4 kg/ha/day and hence N-fertiliser application can be reduced significantly, or even be zero [for details see Kikuchi 1993].

4 Based on our discussions with the scientists at the experimental farm on 'Paddy Cultivation and Global Warming' at the International Rice Research Institute, Los Bonas, Philippines, July 1993.

5 These technologies range from fully computer-controlled drip and sprinkler irrigation systems using salt water to growing horticultural crops with little or no soil support. Though these technologies are limited to some fruit, vegetable and horticultural crops till recently, now other crops like cotton, wheat, etc. are also grown with these technologies. Even in Rajasthan in some regions wheat is grown with brackish water (with flood irrigation method) though at lower yield levels (about 1/2) compared to sweet water irrigation. Presently efforts are on to bring in some of the Israeli technologies to Rajasthan.

6 Cultural practices of the indigenous people also seem to have stronger influence on the conservation of natural systems. For instance, in parts of arid and desert regions of Rajasthan one sees plenty of trees in the areas predominantly of Bishnoi community which is traditionally a nature friendly community. This community forbids cutting trees and eating non-vegetarian. In fact, they worship the khejdi tree. Though firewood is a major problem in these areas one sees people picking dry stems in the open field. However, these cultural practices seem to be somewhat ineffective during extreme famine conditions when people resort to cutting trees and selling the firewood in the near-by towns.

**THE RIGHT TIME
TO FIGHT
A FIRE IS
BEFORE IT HAS
A CHANCE TO START.**

Prevention, they say, is better than cure. And when it comes to industrial fires, prevention is all the more important. Since there is hardly any cure in the aftermath. Industrial fires cause major losses, even death. They could even wipe out the entire business, and destroy the livelihood of thousands of workers. Prevention is therefore the best remedy.

Train your personnel in fire prevention and fire fighting. Keep them fit with regular drills and refresher courses. And make fire safety a way of their life.

**Loss Prevention
Association of India Ltd.**

(LPA) is a non profit organisation promoting safety and loss control through education, training and consultancy. LPA organises workshops, publishes safety literature, conducts training and offers consultancy services to identify potential risks and suggest remedies.

Planning Kerala's Irrigation Projects

Technological Prejudice and Politics of Hope

V Santhakumar
R Rajagopalan
S Ambirajan

The political objective of achieving self-sufficiency in rice production in Kerala supported the planning of major irrigation projects in all the river basins of Kerala. The irrigation engineers who planned these projects showed a technological prejudice as they rarely sought alternative methods and scales of irrigation in each of these basins. This prejudice is of serious concern in a high rainfall area like Kerala, where the dam and canal-based system is 'naturally' costly and where there is a possibility of meeting the relatively small requirement of additional water through less expensive means. The objective of achieving self-sufficiency in rice and the policy of having major irrigation projects in all the basins seem to be based on the neglect of the specific agro-climatological and agro-ecological features of humid-tropic Kerala.

I

Introduction

WATER and rainfall were considered as divine blessings in the traditional agrarian societies of south India.¹ Local mechanisms and institutions existed even during the last millennium for controlling and harnessing water resources in these societies. Whether the need to control water and provide irrigation led to the emergence of political control in these societies is debatable.² One can say, however, that the control of water definitely became an important means of social control for these political structures.³ Even during the medieval period, much of the initiative and responsibility for developing and maintaining irrigation systems rested with the local collective groups.⁴ But British rule brought in considerable level of concentration in the decision-making and management of irrigation. The emergence of macro-level planning, the concern for economic returns for the state and the evolution of a technobureaucratic organisation for the development and management of irrigation projects were the essential features of the British period. The post-independent period witnessed massive investments and increased political patronage for irrigation projects, the accelerated growth of the technocratic organisation and the sharpening conflicts between the different groups for sharing water resources. Irrigation in India continues to exhibit the effects of all these historical processes. The conflicts between different interest groups, the view of irrigation as a means of obtaining political mileage, the decisions of the technologists influenced by their disciplinary biases, self-interests and organisational needs, etc. pose various political, technological and resource-use problems in irrigation and water management.

This paper is a study of the irrigation development in a high-rainfall region of south India, namely, Kerala, and attempts to explore the following questions: To what extent have the technology policies in irrigation been

appropriate to the ecological (and climatological) features of the region? What are the socio-political factors that lead to the selection of a technological system in irrigation?

The extent to which the geography (and the climate) determines the direction of irrigation development in a region is a matter debated by the scholars.⁵ However, no one denies the need to consider this factor in the decision-making on the nature and the method of irrigation. This is more crucial in high-rainfall areas than in semi-arid and arid regions. The widely acknowledged 'unsatisfactory status' of major irrigation projects in Kerala necessitates an evaluation of the policies in the context of the specific 'natural' features of that region. This paper is an attempt in that direction. We have also tried to review the process of technological planning in irrigation and the political framework that supported major irrigation projects in this state. The approach of the irrigation engineers is studied through the analysis of the proposed Vamanapuram irrigation project (VIP) currently being implemented in the district of Trivandrum.

Three major sections follow this introduction. Section II consists of a brief description of the historical developments in irrigation in Kerala. This section also includes a summary of different studies on irrigation in the state. The planning approach of the irrigation engineers as seen from the proposal of the Vamanapuram project is analysed in Section III. A discussion of this approach in the context of some of the climatological and ecological features of Kerala is given in Section IV. Some concluding remarks on the technological choice and the political framework are made in the last section.

II

Irrigation in Kerala

Traditionally cultivation in Kerala depended solely on the monsoons. Farmers had a detailed empirical knowledge of the meteorological events that influenced

agriculture. Using this knowledge, they could predict (with reasonable accuracy) the commencement of the monsoon, the intensity of rain during different periods, the availability of sunlight, etc.⁶ This helped the farmers considerably in making their cultivation practices and other activities fit into the rhythm of the monsoon.

The provision of supplementary irrigation during the dry spells within the monsoon periods was also practised in Kerala. This was done through the construction of temporary structures in the small streams by the individual farmers or by small groups. This rarely required either large-scale collective work or state-intervention (unlike in the other parts of south India).⁷ Thus the intervention of the state in irrigation started only in the 20th century in the geographical areas which became parts of Kerala.

The construction of dams and canals for providing irrigation started in Kerala only in this century. During the early decades of this century Kerala was not thought to require major irrigation projects because of the abundant rainfall. For example, Nagam Aiya, the author of the *Travancore State Manual* of 1906, observed that most of the lands in Kerala 'cannot be irrigated artificially'.⁸ He continued, "Even where they can be (irrigated), such irrigation is rendered unnecessary by the almost regular fall of rains throughout more than half the year". The assertion of Nambuthiripad, the marxist leader, as late as in 1952 that "cultivation in Kerala in a normal year does not require artificial irrigation" also indicated this.⁹

One reason for a change in this attitude was the shortage of foodgrains faced by this region during the second world war with the fall of Burma and the consequent restrictions on the movement of rice. This region had been importing rice from the late 19th century.¹⁰ This led not only to the efforts to increase rice production but also to the emergence of a slogan of achieving self-sufficiency in foodgrains in Kerala.

The pre-independent governments of Kerala adopted various strategies for

increasing rice production. The Travancore and Cochin governments allowed the conversion of large stretches of forest areas for the cultivation of food crops like paddy and tapioca.¹¹ The engineers of the Madras government started planning a few medium and small irrigation projects in Palakkad and nearby areas during the late 1940s.¹² In Travancore, the governmental organisation responsible for the maintenance of irrigation projects in Nanchilnadu (which later became part of Tamil Nadu) started planning projects in other areas. Thus the construction of three major and medium projects commenced during the late 1940s.¹² Before the formation of the first elected government in the state in 1957, work on 10 major and medium projects had started.¹¹

These strategies were useful in increasing agricultural production to some extent. The target of self-sufficiency however was based on some estimates of achievable levels of rice production in Kerala. A report on the 'Water Resources of Kerala', prepared in 1957 as "the first comprehensive attempt to formulate policies and projects for the development of water resources in the state",¹⁴ gave one such estimate. Based on the statistics of 1951, it was estimated that 1.2 million acres of land could be converted into fields yielding an average of 2.5 crops of paddy per year through the construction of major irrigation projects. This was expected to produce 2.1 to 2.7 million tonnes of rice per year satisfying the needs of 13.6 million of people (population as per 1951 Census) and of a modestly increased population in future.¹⁵ The net area of cultivation at that time was 1.325 million acres and the report did not expect any major increase in this figure. The increase in production was to be achieved mainly through the increase in cropping intensity. In essence, the realisation of the target of self-sufficiency hinged on the implementation of major irrigation projects covering 85 per cent of the land sustaining paddy cultivation.

This approach of "self-sufficiency in foodgrains through irrigation" received the support of the political leadership in Kerala. All the elected governments allocated a considerable share of plan resources to the irrigation sector – about 15 per cent of the total expenditure in each of the Five Year Plans. Considering the fact that the crops other than paddy were considered for irrigation only during the 1980s, one can see that almost the whole investment was meant for paddy. Out of the total investment in irrigation till 1990-91 (Rs 9,645.7 million), Rs 7,916.1 million (82 per cent) was spent for major and medium irrigation projects.¹⁶

The 10 projects started before 1957 (and commissioned by 1975) involved a total expenditure of only Rs 235.4 million.¹⁷ Seven of these were in Palakkad district and one

was to the south of Trivandrum – a region neighbouring Nanchilnadu and geographically similar to it. Thus these early projects were limited primarily to the semi-arid regions in Kerala (barring one diversion weir in Chalakkudy and a dam-based system in Trichur designed to support the summer cultivation of the koler lands). However, the objective of achieving self-sufficiency led to the planning and implementation of dams and canals in other regions very different from Nanchilnadu and Palakkad. None of these projects started after 1957 have been commissioned fully until now. Eight of them, started by the early 1960s and costing together Rs 8,282.3 million, provided irrigation to only 60 per cent of the targeted area even by 1991-92.¹⁸ On another 10 projects started after 1975 Rs 1,127.9 million have been spent yielding no benefit so far. Because of the delay in commissioning the projects, the actual cost increased several times that of the original estimate (the highest figure being 33 times!).¹⁹ The estimated cost of irrigation for the projects was also high, varying from Rs 30,000 to Rs 1,10,000 per hectare.²⁰

The inordinate delay in commissioning the projects, the escalation of project costs, the high cost of irrigation and the realisation of benefits far less than the estimated ones made even the planners and the administrators unhappy over the performance of the irrigation sector. All the economic surveys published by the State Planning Board after the late 1980s noted that the performance of the sector had not been encouraging.²¹ If this showed the unsatisfactory status of the functioning of the irrigation sector as per the government records, the status of the actual use of irrigation projects in Kerala, as shown by a few studies, was even more depressing.

The first note of caution against the policy of stressing heavily on paddy through massive investments in dam-based major irrigation in Kerala came from the techno-economic survey conducted by the National Council for Applied Economic Research (NCAER) in 1962. After considering the non-availability of "vast areas of cultivable land" that could be opened up by the construction of the project, the study observed "that a greater emphasis should be placed on minor rather than on major irrigation projects".²² Moreover, the study advocated the cultivation of commercial crops in Kerala using the relative geographical advantages.

Analysing the developments in irrigation in Kerala until 70s, George and Nair have noted that the "benefit of these projects (major irrigation) consists more in the stability it has imparted to crop yields than the increase in productivity".²³ They also showed that the contribution of these projects had been "mainly to help the stabilisation of crops through supplementing the existing source of water". Through the analysis of

talukwise data, Narayana and Narayanan Nair have shown that the contribution of irrigation projects to the stabilisation of crops was by and large limited to the autumn crop.²⁴ The (improper) working of the organisation responsible for the conservation and allocation of the water resources, improper planning and practices such as inflating the size of the command area to attract financial resources from the central government were cited as possible reasons for not achieving the estimated benefits. Through the analysis of yield rate and the influence of irrigation, Kannan and Pushpangadan also observed that irrigation in Kerala had not made any impact on the yield rate of paddy.²⁵ They found no evidence to suggest that irrigation had either stabilised the crops or increased the cropping intensity even in Palakkad district where the public investment in irrigation had been the highest. However some scholars have questioned the usability of macro-level cropping data for analysing the impact of irrigation.²⁶ Considering the similarity of observations of these studies and the absence of any study that showing a higher level impact, one can derive the following modest conclusion from these studies: Irrigation in Kerala contributed neither to a significant increase in the yield rate nor to an increase in the cropping intensity; its limited contribution was towards the stabilisation of the ongoing cultivation and the corresponding yield.

The minor irrigation projects also could not yield the benefits to the estimated level.

TABLE 1: BASIC STATISTICS OF THE VAMANAPURAM IRRIGATION PROJECT

Project Area :	Dam in Vamanapuram river at Valayanki near Vithura on the Trivandrum-Poamudi road
Command Area :	The southern part of the Vamanapuram basin situated in the Trivandrum, Nedumangad and Chirayinkil taluks of the Trivandrum district
Dam :	Height 72m Length 324 m Random Rubble Masonry
Reservoir Area :	340 Hectares (200 ha of forest and 140 ha of agricultural land)
Storage :	8.16 cubic metres
Catchment Area :	5300 ha
Estimated Cost (in Rs crore):	
Dam and Headworks :	12.950
Main Canals :	16.305
Distributaries :	4.525
Water Courses :	0.475
Establishment :	4.425
Total :	38.680
Estimated Benefits:	
Annual returns (in Rs crore) from	
Garden lands (6978 ha) :	8.24
Wet lands (2540 ha) :	1.60

In an evaluation study conducted by the State Planning Board in 1975, it was seen that inflating the size of command area to meet the 'unrealistic' criterion adopted for sanctioning the scheme led to the non-achievement of the estimated targets.²⁷ These projects were successful neither in bringing additional area under cultivation nor in increasing the cropping intensity. In essence, the contribution of minor projects was also limited to the stabilisation of the ongoing cropping of paddy.

However, the allocation for major irrigation projects continues to be high even today. The allocation for the Fifth Plan (1974-79) was 16.22 per cent of the total plan outlay. The total investment in this sector till the end of 1991-92 came to Rs 10,490.2 million. Out of this, the investment during the last 10 years amounted to Rs 7,600 million.²⁸ The annual investment in this sector during the early 1990s was about Rs 850 million. It should be noted that this policy was followed in a geographical area where the importance of paddy cultivation had been declining considerably due to several reasons. The share of paddy cultivation in Kerala's agriculture declined from 38 per cent in 1952-53 to 31 per cent in 1975-74.²⁹ A study which analysed the agricultural situation in Kerala during the period between 1962-63 and 1985-86 found that both the area of cultivation and the total output of paddy declined after 1974-75 in spite of a marginal increase in productivity.³⁰ 'Decline in profitability' was considered as the major reason for this situation.

Considering the fact that both minor and major projects contributed only to the stabilisation, alternative methods of irrigation need special consideration in Kerala. Thus the central issue in Kerala's irrigation policy is not the level of impact of a particular type of technology but the question whether the irrigation planners consider alternative technologies and different scales of operation before deciding on a project for a given river basin.

It is thus necessary to study the technological planning done by the irrigation department of Kerala. The methodology of planning, the explicit and implicit assumptions of the planners and the overall policy framework have to be understood if we want to explain the functioning of major irrigation projects. We have taken up the Vamanapuram project for a detailed study of the planning process.

III

Proposed Vamanapuram Irrigation Project (VIP)

The idea of building a dam in Vamanapuram was an old one mentioned even in the report on the water resources of Kerala which, as mentioned earlier, prescribed the

broad policies for the utilisation of water in the state. However, the project in its present form was formulated in the early 1970s by the irrigation wing of the Public Works Department (PWD) and submitted for approval in 1973 to the Central Water Commission (CWC). In 1980 the CWC observed that the cost per ha of the gross irrigated area was high for the project when compared to other regions.³¹ In order to satisfy the CWC, the PWD resubmitted the proposal in 1980 after making a few changes in the cropping pattern to be adopted in the command area. Since the irrigation department of Kerala found "no scope for any substantial reduction in the cost of the scheme", it modified the cropping pattern to be adopted in the command area.³² The basic statistics of the proposal is given in Table 1 and the details of the existing and proposed cropping patterns are given in Table 2.

A casual reading of the proposals gives the impression that it consisted only the details of the dam, canal system and an estimate of the benefits that could be derived from the project. It was as if the engineers merely proposed one technological option and left the decision-making (regarding the necessity of the project, choice of the scale and technology) to the political and administrative machinery. However, a closer study of the proposal shows that it was not all that neutral and it ruled out other methods of irrigation and other options for developing the region. The original proposal started with the reaffirmation that every river basin should have a major irrigation project.³³ The central part of the section which dealt with the 'necessity' of the project had self-sufficiency as the theme.³⁴ After stating the fact that the total production of rice would be just sufficient to meet 50 per cent of the total requirements, the proposal concluded that the increased production of rice with better irrigation facilities had become imperative.³⁵ Stating that the main occupation of the majority of the population was bound to be agriculture for a long time to come, it suggested the construction of an irrigation project "to raise three crops in most parts of the command area" and "to increase the employment opportunities of the agricultural labour at least two-fold".³⁶

These justifications have several problems. First of all, it is clear that the engineers were not ready to leave the decision-making to others without arguing their case. Secondly, the consideration of this proposal as a technological one raised an expectation of 'rationality' in the minds of the people and their representatives. However, one can see different levels of rationality in this document. At the elementary level, the proposal carried quantitative data of water resources, scientific calculations and the design formulations of a particular

technological project. At the second level, the benefits of the choice were projected on the basis of many unsubstantiated positions. At the third level, the necessity of the project was grounded on an 'ideological' and 'value-based' attitude. However, these unsubstantiated positions and the value-based attitude have been covered by the 'rationality' of the elementary level. Such a cover-up did not allow a free debate of the non-scientific positions taken by the technological organisation. The political and the administrative set up also failed to separate the rational element from the other factors.

'CLOSED RATIONALITY'

The proposal contained the scientifically collected data on water resources that could be made available through the construction of the dam. However, the data on the availability of the water resources at the proposed command area was neither collected nor estimated realistically.³⁷ The fact that the command area of the proposed project received 200 to 300 cm of rainfall made this omission a critical one. The data collection system which included 10 rainfall stations and six stream gauges at the main river was not adequate for realistically measuring the locally available water in the micro-watersheds of the command area. It should be noted that only the main river was gauged and all the small streams reaching the river were left unmeasured. That meant that any developmental measure designed on the basis of this data would eventually become a river-based one. The lack of data on the actual water availability at the command area led to two problems. First of all, a realistic assessment of the actual demand for water to be provided through irrigation was not available. Secondly, the planners could not think of methods of managing water available locally and at the small streams. Thus the possibility of meeting the requirement of irrigation with locally available water was closed without a proper examination.

The cost estimates in the proposal lack the 'scientific rigour' visible in the design data of the dam and canal network. The proposal did not have the details of the whole canal network. The exact location and the detailing of the smaller canals were left undecided. There was only a nominal provision (an amount of Rs 4.75 million for an area of 9,400 hectares) for the construction of water courses to distribute the water to the fields.³⁸ A field study of the topography of the proposed command area found that nearly 32 per cent of the garden lands, which were also included for the provision of irrigation, were situated at levels higher than that of the canal system.³⁹ The cost of pumping to irrigate these lands was neither estimated nor incorporated in the cost-benefit analysis.

Even if we leave aside the problems in estimating the costs, it can be seen that the 'rationality' at this level of scientific designs was a 'closed' one in the sense that this exercise closed, without examination, many technological options and led to the selection of a particular one. In other words, the exercise had the limited objective of supporting a particular technological option selected on the basis of some pre-judgments

UNSUBSTANTIATED BENEFITS

The benefits of the project as estimated in the original and revised proposals have been listed earlier. The figures of the existing cropping pattern given in the revised proposal showed the inaccuracy of the assumption in the original proposal that the major part of the command area was sustaining paddy cultivation.¹⁰ This inaccuracy was not incidental but came out of the basic approach of irrigation planning followed in Kerala until the late 1970s. First, the approach was not concerned with the real status of the land-use pattern since its sole objective was to convert the major part (if not the whole) of the command area into treble cropped paddy fields. Thus the planners were unconcerned with the wetland/dryland classification. (A reference to any geographical record would have shown that paddy was cultivated mainly in the wetland whereas the dryland (or the garden land) was used for growing trees and other crops.) Motivated by the urge to attain self-sufficiency in rice production, the irrigation planners envisaged the conversion of the whole command area into paddy fields irrespective of its topographical position, natural moisture and prevailing crop cover. They appear to have been unconcerned with the profits generated by different crops *vis-a-vis* paddy or with the cost of irrigating paddy *vis-a-vis* other crops.

However, the CWC's suggestion that the proposal be revised to increase the benefit-cost ratio forced the planners to rethink their cropping strategy. The criticism that the irrigation planners neglected the other crops and the overall shift in the land-use pattern in Kerala towards non-paddy crops also motivated them to include these crops under irrigation. This time the technical committee constituted by the irrigation department collected the latest land-use pattern of the command area.¹¹ In the cropping pattern conceived by this committee, there was a considerable de-emphasis on paddy cultivation.

A study of the new cropping pattern would show that the basic aim of the revision was to have a pattern that could generate more profits through the consumption of the water to be provided by the project. Phrases such as "since water is available" were frequently

used in this exercise to justify the inclusion of water-hungry crops in the place of crops needing less water.¹²

If the need to achieve self-sufficiency is taken away, then the basic objective of adopting any cropping pattern would be to maximise the economic return. In that case, different cropping patterns would have to be conceived with their respective costs (including cost of irrigation) and benefits. In the absence of any non-economic bias in favour of a particular crop, the cropping pattern which would yield the maximum economic return should have been considered.

In the process of revision, such an optimisation of the cropping patterns was not attempted. The crops requiring less water and possibly yielding profits equivalent to others were either excluded or given low priority in terms of area. A partiality for food crops did not influence this selection. Inclusion of pepper and banana and the neglect of tapioca and rubber showed that the only criterion for inclusion was the consumption of more water (Table 2). (A field study of the proposed command area conducted in 1992 showed that the area under rubber was rapidly increasing. This seemed to be the optimisation strategy adopted by the farmers.¹³)

Thus the cropping pattern suggested for the project turned out to be a mere justification for the construction of the project. The construction of the project, justified earlier for increasing paddy production, was later shown beneficial through the adoption of a water-hungry cropping pattern with less emphasis on paddy. The earlier estimate was based on a dream or the 'political goal' of self-sufficiency for which the details of the field realities were of little significance. The revised proposal dictated a particular cropping pattern, devoid of any nationalistic objectives for the construction of the dam and canals. In both the situations, there was no rational framework for taking decisions other than the one influenced by the need to construct the project.

SUGAR COATING: THE THEME OF SELF-SUFFICIENCY

If the elementary calculations of the proposal were based on a 'closed rationality' (without exploring all the possibilities for providing irrigation) and if the projected benefits were based on unsubstantiated claims, then the 'outer cover' of the proposal, was made on the theme of 'self-sufficiency'. Though one should not seek any rationality in such value-based premises, the use of

such a theme for the justification of a technological proposal warranted careful examination. At the time when this proposal was originally formulated (in the early 1970s), the excess of demand over the production of paddy was beyond the estimates of the water resources report which linked the theme of self-sufficiency to major irrigation projects. In spite of this, the proposal used the self-sufficiency argument as justification.

The original proposal envisaged the conversion of the whole command area into paddy fields, unmindful of the fact (as revealed in 1980) that only 2,333 ha out of 9,518 ha was sustaining paddy (Table 2). The economic and social viability of such a conversion was not considered in the proposal. The fact that the cultivation of crops other than paddy was more profitable (as shown by the calculations of returns in the revised proposal) was either neglected or considered unimportant. The economic studies of the Kerala Agricultural University conducted even in Palakkad district which has the maximum number of irrigation projects, advocated the "replacement of second crop of paddy also by other better paying and water-use efficient crops".⁴⁴ The experience of the implemented projects which failed to induce the conversion of dryland into paddy fields was also overlooked. Moreover the proposal did not attempt to analyse the impact of ignoring the comparative advantages of the region in terms of growing other crops.

Thus the premise that Kerala should achieve self-sufficiency in rice production was a value-based standpoint. This position would have been harmless if separated completely from the technological package and debated widely. But this standpoint was used to give credibility to the technological proposal of the irrigation project. The other elements of the proposal would not have been considered rational if they had not been posed as means of achieving self-sufficiency. In essence the need of the irrigation project itself was grounded on the objective of achieving self-sufficiency in rice production.

However, the revision to a different cropping pattern for increasing the benefit-cost ratio of the proposal (to meet the requirements of CWC) showed that the irrigation department itself did not attach much importance to the self-sufficiency objective except for the purpose of justification. When the need to justify the project was over, the department was quick to abandon the slogan. When confronted with the question of profitability, the answer was sought in a non-paddy cropping pattern which could generate more profit. Thus the value-based standpoints were proven to be mere attachments to strengthen the case of those technological positions which would have been questioned otherwise.

The problems discussed here did not pertain to the Vamanapuram project alone. Because of the revision, this project was a somewhat refined one in terms of the calculation of the benefits. The overestimation seen in the original Vamanapuram proposal was the standard pattern seen in all the other projects under implementation. A perusal of a number of these projects shows the similarity of approach. Except the use of different data, the algorithm of planning used in these proposals is quite similar and goes as follows:

- suggesting the site of the dam;
- calculating the possible storage;
- designing a dam and other headworks;
- proposing a canal network on the basis of topography;
- designing canals and related structures;
- calculating the cost of dams and canals;
- assuming the conversion of the total command area into treble-crop paddy fields;
- calculating the water requirement nearly neglecting the locally available water;
- calculating the benefits on the basis of the earlier assumption;
- projecting a cost-benefit ratio.

Thus the selection of the project, the method of irrigation, technology, etc. were based on some pre-judgments. The highlighting of a particular option as the best one was completely based on a polemical exercise.

From the experience of the implemented projects, it also became clear that the objective of achieving self-sufficiency through the implementation of major irrigation projects in all the river basins was formulated ignoring the specific agro-climatological and agro-ecological features of humid-tropic Kerala.

IV

Agro-Climatology and Agro-Ecology of Kerala

The following specific topographical, climatological and ecological factors of Kerala need special attention.

(1) The paddy cultivation in Kerala is limited to those areas which are naturally suitable for that purpose. These areas are: the narrow valleys in the midland and the highlands; the wider valley portions situated near the coast; water-logged areas of the backwater and coastal regions and the larger stretches of land in the semi-arid Palakkad district. Except in Palakkad, the conversion of dry land (or the garden land) for paddy cultivation is naturally and economically infeasible. This is naturally infeasible because of factors such as the soil type (more pervious), slope, etc. It is also economically infeasible because of the fact that the opportunity cost of conversion is very high. These drylands are not unused patches of lands as in other parts of India. Instead these

are covered by a multi-tree/crop system which can produce a variety of commodities. Because of high rainfall, these lands can also support a variety of trees and plants which are more profitable than paddy. That is why the implemented projects could not increase the net area under paddy cultivation.

(2) Except in a few zones like Palakkad, paddy cultivation is done in areas having annual rainfall ranging from 200 to 300 cm. Table 3 shows the water situation in a representative small watershed in midland Kerala. (Though this watershed is not under the proposed command area of VIP, it has been included in another proposed project.) During the first crop period, (between May and August) direct rainfall alone is sufficient to meet the crop-water requirement. In fact the main problem during this period is the excess water and the absence of proper drainage. Apart from the direct rainfall, the paddy fields, by virtue of their position in the valleys, receive a considerable part of the rain falling over the surrounding (high altitude) garden lands. In general, garden lands account for about two-thirds of the total area and the valley comes to one-third. For example, in the command area of the Vamanapuram project, 6,978 ha of garden land surrounds 2,450 ha of the paddy fields. Water from the dryland reaches the paddy fields as surface as well as sub-surface drainage, which means that the contribution from the surrounding land does not stop immediately after the withdrawal of the monsoon. The direct rainfall as well as the drainage from the surrounding area keep the field sufficiently wet for most of the days during the first and second crops. Though there are variations from place to place, the actual number of days requiring supplementary water is very small for the majority of the fields. Even if the paddy fields become dry, the stream draining runoff from the nearby land would have water for some more days (until the middle of December) which can be used for cultivation through small diverting structures. (Table 3 shows runoff during December as '0.00'. This was because of the blocking of the stream at several points by the farmers to provide supplementary irrigation.⁴⁵) Thus the actual number of days requiring irrigation from an external source is further reduced. This in turn reduces the real additional benefit that can be provided by an irrigation project.

The field level studies on water management conducted by the Kerala Agricultural University also showed the fact that the actual requirement of surplus irrigation in Kerala was much less than the previous estimates. A study conducted in a farmer's field in Palakkad district concluded that the provision of irrigation water can be delayed up to five days after the disappearance of the ponded water.⁴⁶ This according to the study leads to the saving

of considerable quantity of water with negligible yield reduction compared to the continued submergence as envisaged in the irrigation projects. In another study conducted at the Regional Research Station at Pattambi for a period of four years from 1982, showed that the yield rates of paddy were on par in fields with continuous submergence, with irrigation two to three days after disappearance of ponded water and with irrigation once in six days.⁴⁷ This showed that the irrigation requirement is much less than fifty per cent of the estimate made on the assumption of the need for continuous submergence. The relatively shallow level of the ground water table and the consequent higher level of natural moisture in the soil are considered as the factors leading this situation.

The studies conducted at the Agronomy Research Station in Chalakkudy during the 1980s also "revealed that the irrigation for second crop can be withheld even up to five days after the disappearance of the ponded water with only slight reduction in yield but considerable saving of irrigation water".⁴⁸ This study showed that the water requirement is 83 cm less than the estimated one for continuous submergence (However the continuous submergence was used as a means of controlling weeds. In this case, one has to consider the cost of continuous submergence through irrigation *vis-a-vis* other means of weed control.) This study also concluded that the moderate rainfall during second crop and the shallow ground water table conditions resulted in reduced requirement of irrigation. Continuous submergence was proved unnecessary in the earlier studies also.⁴⁹ In another study conducted at Chalakkudy it was found that the yield rate would not be reduced significantly even if only 25 per cent of the water required for continuous submergence was used.⁵⁰ Thus the actual requirement of irrigation water for stabilising the second crop is much less than the estimates of the irrigation projects.

In the original proposal of the Vamanapuram project, the planners had the problem of showing the use of large supplies of water that would be provided by the irrigation project. That is why they nearly neglected the locally available water and showed the necessity of 'importing' water. However in the revised proposal, the engineers showed a more realistic understanding on the hydrology of the command area and conceded the availability water as direct rainfall and drainage to the paddy fields.⁵¹ These local resources have been included to some extent in the calculation of the water requirement. In this case, they have conceived a water-hungry cropping pattern which could consume both the local and the imported water. Thus the assessment of the local level hydrology has

not led to the selection of an optimal cropping pattern for those areas.

(3) Summer cultivation of paddy in those places where natural moisture is insufficient requires very large amounts of additional water to meet the high evapo-transpiration requirements and to sustain itself in the high temperatures of these months. From Table 3, it can be seen that the maximum temperature and the evaporation requirements from December to May are significantly high and the rainfall during these months extremely meagre. While looking at the other tropical states in India, one can see that irrigated agriculture is practised during the non-rainy, non-summer months. Irrigated paddy cultivation during summer months in tropical climate seems an infeasible option. For Kerala, the non-rainy, non-summer period is extremely short. The evaporation from the reservoir and the canals, the seepage from the canals, high evapo-transpiration at the field, etc. make the summer cultivation (based mainly on irrigation) in Kerala a non-realistic dream. That is why, even in those districts having completed irrigation projects, summer cultivation of paddy is still limited to those areas where natural moisture level is high. Only those areas such as some portions of the narrow valleys where the residual moisture is high (in Vamanapuram project, such area comes to 286 ha)⁵² and the water-logged areas near the coastal and back water region can sustain paddy cultivation during summer in Kerala.

(4) If irrigation planners move away from their previous stand of aiming at self-sufficiency in rice production and attempt to provide irrigation to other crops also, then they should consider the agro-ecological situation of Kerala which sustains a wide variety of crops having different levels of demand for additional water. Since many profitable crops needing less water can be grown in the region, the attempt to establish a irrigation dependent cropping pattern

without considering alternatives may have social, economical and environmental implications on a long-term basis. The case study of Vamanapuram project shows that the irrigation department followed this path merely for the sake of constructing an irrigation project.

We do not argue that irrigation projects are not at all necessary for Kerala. However, considering the marginal requirement of additional water, considerable amount locally-available water, the possibility of growing other profitable crops in drylands and dry seasons and the limited impact of the implemented projects, it can be said that seeking alternative, less expensive methods of providing supplementary irrigation is very important.

By and large technologists neglected these facts and pursued more or less a singular path in planning irrigation projects. The fact that neither the technologists nor the policy makers gave due consideration to the specific features of Kerala necessitates further discussion of the functioning of these groups.

V

Technological Prejudice and Politics of Hope

Why did the planners and the politicians adopt and continue a technological policy which was clearly inappropriate to the specific ecological characteristics of the region? This question takes us to the implicit assumptions that both the technological and the political leadership have on science, technology and ecology. In another way, the question also brings out the mutually-dependent relations between the technocrats and the political leadership, which clearly serve their self-interests.

At the outset, the belief that science and technology are omnipotent tools for making beneficial changes to nature have prevailed in the minds of policy-makers, technologists and even people at large. The words of

V R Krishna Iyer, who wrote the foreword to the *Water Resources Report* as the then irrigation minister summarised this belief: "In a superstitious age, mighty forces of nature were defied and offered prayers. In an age of Science the powers of nature are imprisoned for the service of man".⁵¹ As philosophers have observed, this belief on 'rational science' was seldom based on rational grounds.⁵²

The political leadership in Kerala, which consisted of people from a wide spectrum of ideological positions from Nehruvian socialism to different varieties of Marxism-Leninism, had a common attitude to S and T and encouraged similar developmental projects. As noted by scholars, their difference in perception was mainly on the pattern of sharing the benefits of development.⁵³ It was not incidental that, in the debates on ecology and development, the major political parties in Kerala have taken the identical position considering all the efforts of environmental protection as obstructions on the path of development.⁵⁴

The aim of achieving self-sufficiency in a region also pointed to an ideological position in terms of development. Here the theme of self-sufficiency has been extended to the level of individual states within the nation. This idea of self-reliance visible in the agricultural policy of Kerala needs a little more elaboration. At one level, the proponents of self-sufficiency have overlooked the characteristics of the traditional agricultural system of Kerala. For example, rice alone was not the staple food even in traditional Kerala. Instead, many tubers and fruits were used as the semi-staple food. The policy of self-reliance did not show much interest in building on the naturally adopted food-production system in Kerala. Thus the policy proposed to achieve self-reliance through the neglect of internal systems (and through the use of imported systems and technological paradigms!). The economic criticism that a policy of self-reliance might lead to the neglect (and the eventual destruction) of the comparative advantages of the region is also valid in this context.

Another assumption is that of the universal validity of science and technology. This assumption led to the use of similar technologies in all the regions irrespective of their social, economic and ecological features. The assumption is considered valid even for technologies like agriculture which depend heavily on geographical features. This led to a 'blind import' of technology from western developed countries to the third world and from some regions of the developing country to others. Thus the same irrigation technology that was successful in other parts of India, was applied also in Kerala. The difference in climate and ecology of Kerala was either overlooked or considered insignificant.

In addition to these broad assumptions, the self-interests of the different groups also played an important role. The engineers did not seek all the possible solutions for solving the water problem and they used their scientific expertise only for the design of one particular type of technological project. They showed a technological prejudice that the best method of providing irrigation was to have dams and canals irrespective of the region's social, economic and ecological realities. Such a prejudice could be seen in their knowledge system also as shown by a study of the irrigation research conducted in independent India.⁵⁵ The emergence of civil engineers as the sole technologists and managers of the state-sponsored irrigation systems in the 19th century because of some historical reasons, has continued to make its impact on irrigation development and management.⁵⁶ Their technological prejudice is manifested in the neglect of the traditional systems of irrigation and their management mechanisms. The same disciplinary bias could be seen in the neglect of geography and ecology in the planning of irrigation projects in Kerala.

As noted by the engineers themselves, their tendency was to neglect all other things except the construction of structures.⁵⁷ Those who work in hydrological data collection or design offices considered themselves as 'unlucky' or as undergoing punishment. The corrupt practices, all-pervasive in the construction of public works, have also influenced the choice of the projects for irrigation. Similarly the 'growth needs' of the irrigation department necessitated more projects, that too major projects which could provide a number of jobs at different levels. Thus when the department completed one major project there would be 'severe pressure' to start another major project to engage the team of officials.⁵⁸ Thus the continuous growth of the department during the last decades forced it to look for more projects. The growth of the technological organisation, the increase in the investment in irrigation seemed to follow the 'concentration process' of the public expenditure observed by Peacock and Wiseman.⁵⁹ Once investment starts in a sector, then the level of the investment never decreases. Moreover certain exigencies cause investment decisions (which are tuned more to the needs of the respective organisation). Thus if agricultural development stagnates, then the strategy would be to appoint agricultural officers in all the villages.⁶⁰ Once this higher investment is made, then it would be almost impossible to bring it down and a 'natural' growth in investment is allowed.

The political leadership also was 'not-so-innocent' in using technology for furthering their interests. At the state level, the political leadership did not completely abandon the slogan of self-sufficiency in rice production.

Nor did they attempt to rethink the strategies for achieving this target. The expectation that the construction of irrigation projects would eventually lead to the achievement of this target was used for keeping up the hope of self-sufficiency during the last three decades, while neglecting the signals of non-tenability of such a policy. The proposals of the technological departments could easily attract the uncritical support of the political machinery (if these were packed in the attractive cover of slogans and promises). The political leadership rarely attempted to develop a critical appraisal of the technological projects.

The elected representatives of the Vamanapuram project area, regardless of their party affiliations, demanded the immediate implementation of the project.⁶¹ However they showed little concern for the economic viability of the project and considered the issue of alternatives as a matter to be decided by the engineers and officials. However there was an implicit preference for a larger project, bigger structures and higher investment. Each representative showed an urge to attach his name to the project and wanted at least the commencement of the project during his tenure. (As noted by Bates, these politicians encouraged the people to fight over the 'material spoils of politics' such as the level of government expenditure, the quantity and the location of the public projects.)⁶² Since the cost of the project would be borne entirely by the government, the people and their representatives showed little concern for the cost of the project and demanded its construction at any cost. (The price of irrigation water collected from the beneficiaries in similar completed projects was so meagre that the returns on that account was not sufficient even for covering the maintenance charges.) Since the beneficiaries would derive benefits from insignificant costs, there was no motivation for demanding an alternative project which might be equally beneficial at less cost.

The issues discussed here, such as the non-critical acceptance of the notion of universal validity of the technological systems, the technological decision-making influenced by the disciplinary bias, self-interests and the organisational needs, lack of concern for the opportunity cost of the resources and the political environment that encourages the seeking of 'catchy slogans' without a real concern for the short-term and long-term viability of the policies are relevant in many other sectors of policy-making in developing countries.

IDEOLOGY OF SCIENCE AS A SOURCE OF POWER

The study on Kerala's irrigation shows that science (and technology) serves as a source of power for both scientists and the

political leadership. The belief, structure associated with modern science and technology convinces the scientists, planners and politicians that what they are doing is right. The ideology also convinces the people that what is done for them is right. This twin process of convincing strengthens the privileges and power enjoyed by the scientists as well as the political leadership. Thus science can also be added to the long list of ideological discourses which legitimise the power structure existing within societies.

Since the British days, public works departments have expanded on the basis of a self-serving ideology. These departments were in constant conflict with the administrators of the colonial rule because the department always believed in spending resources supposedly for the benefit of masses while the administrators were concerned about the return on the investments. The rigid belief in balanced budgets and a reluctance to impose heavy direct taxes for fear of political consequences made the members of the civil service take a very critical look at all expenditure proposals except of course on police and the military. However the coalition between the political set-up and the technocratic systems which has emerged during the post-independent period, functions in a manner in which both the partners could pursue their interests without any conflicts. The public perception of the abilities and potentialities of modern science and technology, which is periodically strengthened by the pronouncements of the scientific and political leaders, helps this coalition. Thus one can see clearly how powerful interests use rhetoric of a certain kind to perpetuate themselves under the cover of the alleged 'neutrality' of science or technology.

Notes

- 1 The ancient literary works in Tamil gave much importance to water, rains and clouds. Thiruvalluvar devoted one of the four invocatory chapters to praise rains. According to him, water "is the elixir of life". Silappadikaram starts with a song of benediction in which rain-bearing clouds are given prime place. 54 Many philosophers of this century have questioned the so-called 'neutrality' of science: for a academic presentation of the issue see: Arnowitz, Stanley (1988), *Science As Power: Discourse and Ideology*, Macmillan Press, Hampshire. The belief in the omnipotence of science and technology was part of the positivism which is defined as "the alienation of human reason from itself" (p 5).

55 For a recent discussion of this aspect, see the Introduction in Gadgil, Madhav and Guha, Ramachandra (1992), *The Fissured Land: An Ecological History of India*, Oxford University Press, New Delhi.

56 For example, in the debate of the Silent Valley Hydro-Electric Project, all the major political parties have taken a pro-project stand. The debate in this issue within the Communist Party of India (Marxist) was documented in D'Monte, Darryl (1984), *Temples or Tombs*, Centre for Science and Environment, New Delhi.

57 Santhakumar, V and Rajagopalan, R (1993), 'Technological Prejudice: Case of Indian

Irrigation', *Economic and Political Weekly*, Vol XXVIII, No 14.

62 When the debate of the agricultural stagnation in Kerala was active, then the communist-led ministry (which came to power in 1987) took a decision to appoint agricultural officers in all the villages.

63 This attitude was observed when V Santhakumar did a field project in 1992 to evaluate the VIP, as part of the work of Integrated Rural Technology Centre, Palakkad

64 Bates, R H (1978), 'People in Villages', *World Politics* 1, October, p 145.

OXFAM requires

REGIONAL REPRESENTATIVES FOR NAGPUR AND LUCKNOW

Oxfam, a relief and development agency, is looking for Regional Representatives for our Nagpur and Lucknow offices to provide overall leadership to each regional team and management of our work in Maharashtra and Madhya Pradesh from the Nagpur office, and in the northern region, mainly in Uttar Pradesh, from the Lucknow office.

Candidates should have relevant qualifications, a minimum of 8 years of development experience preferably with NGOs, good analytical and strategic planning skills and understanding of development issues, commitment to social justice, team management experience including finance, research and evaluation experience, good administrative and communication skills, sensitivity to the inequalities facing women in society, willingness to undertake considerable travel, ability to speak fluent Marathi (in the case of Nagpur Regional Representative)/Hindi and also fluency in written and spoken English.

We offer a 5 year contract with reasonable salaries and other benefits to attract competent professionals.

Women candidates are encouraged to apply.

Apply with full CV and a covering letter *explaining fully from your experience how you meet the criteria listed above* to Oxfam (India) Trust, C-6/59 Safdarjang Development Area, New Delhi - 110 016 before 13th May 1995. Only shortlisted candidates will be contacted for interviews to be held in Delhi between 1st and 3rd June 1995. No enquiries over phone or in person please.

Gender and Legal Rights in Agricultural Land in India

Bina Agarwal

Although the Constitution promises no discrimination on the basis of sex as a fundamental right, most inheritance and ceiling provisions relating to one of the most important economic resources in the country continue to be highly gender discriminatory; and the Ninth Schedule lends itself to their perpetuation. Surprisingly, these aspects, which impinge directly and crucially on women's legal and economic status, have received little attention so far from either researchers or activists. This paper attempts to fill some of this gap.

Section I of the paper briefly outlines the process of formulation of Hindu inheritance laws today and their broad features. Section II identifies the major gender inequalities which remain, focusing especially on Hindu women's right in agricultural land. It also highlights the gender discriminatory aspects of ceiling laws. Section III outlines the laws governing Christians and Parsis, including recent changes resulting from Christian women in Kerala challenging gender inequalities in their laws. Section IV traces aspects of contemporary Islamic law, the process of its formulation, and the persisting inequalities especially in women's rights in agricultural land. Summary comments are provided in the concluding Section V.

Thousands of sensitive Hindu women for the first time in their lives left the precious sanctuary of their sheltering homes [during India's freedom struggle]. They came to the battlefield and stood beside their brothers and faced jail and lathi charges and often enough, humiliation worse than death. If today... [they] who fought for the independence of India are to be denied their just rights, then our hard-earned freedom is no more than a handful of dust

— Padmaja Naidu (Congress legislator), parliamentary debates over the Hindu Code Bill in 1951¹

Mat God save us from ... having an army of unmarried women.

— M A Ayyangar (Congress legislator) predicting the result of daughters getting property. Parliamentary debates on the Hindu Code Bill in 1951²

EFFECTIVE rights in property, especially land, are of critical importance for women's economic and social empowerment in India. The path to achieving those rights, however, is strewn with obstacles: legal, social, administrative and ideological [as elaborated in Agarwal 1994]. This paper focuses on the legal aspects.

In particular, it spells out the gender inequalities which persist in laws governing the inheritance and holding of arable land — the most valuable form of property in rural India. On the one hand the progress made toward gender equality in inheritance laws during this century has been seriously limited by the non-applicability of most of these laws, in many states of India, to large parts of agricultural land — the devolution of which continues to be subject to gender discriminatory state-level tenurial legislation and/or custom. Land reform enactments governing the fixation of ceilings are similarly gender unequal in many states. On the other hand, the inclusion of most tenancy and other land reform laws in the Ninth Schedule of the Indian Constitution (whereby

they cannot be challenged for violating fundamental rights),³ although presumably to protect them against interference from entrenched class interests, also effectively protects them from being constitutionally challenged on grounds of gender discrimination. In other words, although the Constitution promises no discrimination on the basis of sex as a fundamental right, most inheritance and ceiling provisions relating to one of the most important economic resources in the country continue to be highly gender discriminatory; and the Ninth Schedule lends itself to their perpetuation.

Surprisingly, these aspects, which impinge directly and crucially on women's legal and economic status, have received little attention so far from either researchers or activists. For instance, while gender inequalities arising from the continued recognition of joint family property in the Hindu Succession Act of 1956 have been much discussed, the effect of exempting tenancy rights in agricultural land from the purview of the Act has largely been neglected. The gender implications of exempting all agricultural land from the purview of the 1937 Shariat Act have similarly been ignored. The same is true of land ceiling laws which, like other land reform laws in India, vary from state to state, most embodying substantial gender inequalities. This paper attempts to fill some of these gaps.

In the discussion below, Section I briefly outlines the process of formulation of Hindu inheritance laws today and their broad features. Section II identifies the major gender inequalities which remain, focusing especially on Hindu women's rights in agricultural land. It also highlights the gender discriminatory aspects of ceiling laws. Section III outlines the laws governing Christians and Parsis, including recent changes resulting from Christian women in Kerala challenging gender inequities in their laws. Section IV traces aspects of

contemporary Islamic law, the process of its formulation, and the persisting inequalities especially in women's rights in agricultural land. The concluding Section V provides summary comments.

I

Hindu Inheritance Laws

(1) HISTORICAL BACKDROP: MITAKSHARA AND DAYABHAGA

Traditional Hindu law defining inheritance practices can be traced to the ancient texts — the *Dharmashastras* — and the many commentaries on them, of which some took the form of digests and legal treatises. In particular, the *Mitakshara* and *Dayabhaga* legal doctrines, dated around the 12th century AD, significantly influenced legal practice in the British period and the formulation of contemporary Hindu law.⁴ Without going into all their complex details, the main features of the two systems that are of relevance here were as follows.⁵

The *Mitakshara* system distinguished between two types of property: joint family property⁶ and separate property. The former consisted principally of ancestral property (that is, property inherited from the father, paternal grandfather or paternal great-grandfather), plus any property that was jointly acquired or was acquired separately but merged into the joint property. A community of interests and rights was recognised in the joint family property, held jointly by (a maximum depth of) four generations of male members — a man, his sons, sons' sons, and sons' sons' sons — who became coparceners on birth. Women could not be coparceners. Devolution was by survivorship: the living coparceners had an interest in the property of deceased ones, and the individual shares could be determined only on partition; these shares decreased in case of births and increased in case of deaths

among the members of the coparcenary. There were severe restrictions on the alienation of coparcenary property, especially immovable property. However, each coparcener had the right to demand partition unilaterally at any time, while the remaining coparceners could stay undivided.

Over his separate property, by contrast, a man had absolute rights of ownership and disposal. This included property which was self-acquired (if acquired without detriment to the ancestral estate) and any property inherited from persons other than his father, paternal grandfather or paternal great-grandfather. In addition, if he had no sons, sons' sons, or sons' sons' sons, his share of the ancestral property obtained on partition was also counted as his separate property. In the presence of these male lineal descendants, however, the partitioned share was still ancestral property, as far as he and any of these descendants were concerned, and his rights of disposal over it stood curtailed [Kane 1946:576, 639-40].

Women's rights in the joint family property under *Mitakshara* included only the right of maintenance as incoming wives (including as widows) and as unmarried daughters: when she married, a daughter was also entitled to marriage expenses and associated gifts. In a man's separate property, however, his widow could inherit a limited estate, but only in the absence of sons, agnatic grandsons, and agnatic great-grandsons,⁷ and only if she remained chaste. A limited estate (also termed a limited interest) meant that the woman could enjoy the property for her lifetime, but she could not normally alienate it (such as by gift, sale, or mortgage), except in a period of severe necessity (later termed 'legal necessity'), and (within reasonable limits) for performing pious and religious acts, especially those seen as conferring spiritual benefit on the deceased.⁸ There appears to be no clear agreement among scholars on the extent to which women's alienation of property for these purposes needed the permission of the reversioners,⁹ but there does appear to be consensus that greater freedom was granted to women in relation to expenditures for religious and spiritual purposes than for worldly purposes.¹⁰ A daughter (an unmarried one got preference) came even after the widow, and a daughter's son after the daughter.¹¹ That is, for a daughter to inherit her father's estate required the absence both of the noted male heirs and of the widowed mother. And when she did inherit, a daughter, like the widow, could receive only a limited estate, except under the Bombay (Mayukha) sub-school of *Mitakshara* which allowed the daughter an absolute estate.¹²

In the early *shastric* texts, however, for sonless families the practice of 'putrikaputra' or 'appointed daughter' was recognised, interpreted either as 'the daughter appointed

as a son' or 'the son of an appointed daughter' [Kane 1946]. In either case, the idea was that the daughter would raise a son for her sonless father. She and her husband were expected to reside with her parental family, her son inheriting her father's estate and taking his name and so continuing the latter's line.¹³ But this system became obsolete over time, as [according to Kane 1946: 714] the ordinary daughter came to be recognised by analogy (after the widow) as heir of a sonless man.

Under the *Dayabhaga* system,¹⁴ a man was deemed absolute owner of all his property (no distinction being made between ancestral and self-acquired property) and could dispose of it (that is sell, mortgage, or gift it)¹⁵ as he wished. The son did not acquire an automatic interest by birth in the father's ancestral property, nor was there any rule of survivorship: each heir took a definite and nonfluctuating share. Division of property among heirs could take place only at the man's death, and the property went in the first instance equally to his sons. The share of a predeceased son would devolve on the son's sons, or failing this on the son's sons' sons. As under *Mitakshara*, a chaste widow could inherit in the absence of these male heirs, but only as a limited interest, with the right to manage but not alienate the property. Daughters came only after the widow, again unmarried daughters getting first preference and inheriting only a limited interest. However, in contrast to *Mitakshara* law, *Dayabhaga* recognised the widow and (after her) daughters as heirs even when the man's share in the joint family estate had not been separated before his death.¹⁶ Hence, unlike under *Mitakshara*, women inherited an interest in all property, irrespective of whether it was ancestral or separate. This also meant that the probability of a widow or daughter inheriting some property was somewhat greater under *Dayabhaga* than *Mitakshara*.

Under both systems, there was also some recognition of female property rights in the concept of 'stridhan' (literally meaning a woman's property), although there were varied and changing interpretations of what stridhan could include, how much control a woman could be allowed over it, and how it would devolve on the woman's death. The discussions around this are too complex and contentious to detail here.¹⁷ Broadly, it appears that in the very early *shastric* texts, stridhan could consist only of movables, given to a woman by her parents, brothers, or relatives before or at the time of her marriage, and by her husband after marriage; over these she was allowed absolute control. In some later texts, especially from the 7th century AD onwards, there was a tendency to enlarge the scope of stridhan in terms of the content and source of the gifts. This also led to controversy among the commentators on whether landed property should be

included in stridhan and what control women should be allowed over it. Several commentators persuasively argue, however, that under *Mitakshara* law, any landed property included in a woman's stridhan which was acquired by inheritance or partition was not intended to invest her with the absolute right of disposal [Agarwal 1994, for details]. The Bombay sub-school again appears to have been an exception: it held that property which a woman inherited from a male of the family in which she was born (e.g., as a daughter succeeding her father), or inherited from a female, became her stridhan and her absolute estate [Kane 1946:783]. In contrast to *Mitakshara*, under *Dayabhaga*, stridhan, by definition, was that over which women had full rights of disposal, but as discussed in Agarwal (1994), effectively (if not explicitly), stridhan property allowed under *Dayabhaga* was limited to movables.

According to both *Mitakshara* and *Dayabhaga*, therefore, Hindu women could inherit immovable property such as land only under highly restrictive circumstances and (barring a few exceptions linked to the Bombay sub-school), at best, could enjoy a limited interest in it. In contrast, men enjoyed a primary right to inherit and control immovable property; and although under *Mitakshara* they too faced certain restrictions in their power of disposal over joint family property, these restrictions related to their rights as individuals (as against group rights), but not to their rights as a gender. Women were restricted by virtue of their gender.

Actual practice and *shastric* prescriptions appear to have converged in some communities and regions and diverged in others [as discussed in Agarwal 1994]. The prescriptions of the *shastras* are likely to have been followed most closely by the higher castes, less by the lower castes, and not at all by the tribal communities [Lingat 1973]. Regionally, tension between the *shastras* and local custom on marriage, divorce, and inheritance practices is argued to have been most in the south and west, and least in the north and east [Derrett 1968; Agarwal 1994]. In the south and west, the evidence surveyed in Agarwal (1994) (especially from medieval temple inscriptions), of women's customary rights in land among patrilineal Hindus in pre-colonial India suggests that a number of women of affluent (including non-royal) backgrounds did possess landed property. However, there is little to indicate that the average Hindu woman was commonly endowed with immovable property. Also, the position even of the elite women who were so endowed appears to have been far from one of equality with men, either in their inheritance rights or in their freedom to use the property as they wished. For instance,

temple donations, one of the strongest pieces of evidence that women from non-royal backgrounds could possess and alienate land, fall into a special category of religious and pious acts which enjoyed social and legal sanction; from this we cannot infer with any confidence that the women who made these donations were as a rule equally free to dispose of their wealth in other ways, even if an occasional one among them was able to do so.

Among the patrilineal tribal communities in eastern and northeastern India, again, women as daughters, wives, and widows typically enjoyed only usufruct rights in land; where this land was inherited, it was essentially in terms of a limited interest. There were, however, some significant although locally confined pockets of matrilineal and bilateral inheritance in southwest India (especially Kerala) and northeast India (especially Meghalaya) where women's property rights were not the exception but the rule. In the southwest, this included matrilineal communities customarily governed by the *Marumakkatayam* and *Aiyasantana* systems which received special consideration in the formulation of the Hindu Succession Act of 1956 discussed further below.

(2) THE FORMULATION OF CONTEMPORARY LAWS

Today, laws governing the inheritance of landed property form a collage across the legal map of India, varying by religion and region. In part these variations originate in the colonial state's characterisation of inheritance and marriage laws as 'personal laws' applicable to members of particular communities – a characterisation that has endured in post-independence codifications that have attempted to accommodate differences in religious and local cultural traditions, while also seeking to establish a degree of uniformity. And partly the variations stem from enactments in relation to the inheritance of agricultural landed property, by provincial (state) legislatures. [After the 1935 Government of India Act (detailed later), agricultural property came under the jurisdiction of the provincial legislatures.]

The formulation of contemporary inheritance laws on property, especially landed property, involved a complex and contentious process of interaction between the (colonial and post-colonial) state and different segments of the population, the interplay of varying ideologies and interests, and the conflicting pulls of scriptural rules and local custom. Around the early part of this century, these interactions increasingly took the form of explicit contestation, especially over women's property rights, revealed most prominently (but not only) in

the pre- and post-independence debates surrounding the Hindu Code Bill in India. Large numbers of Indian women participated in an organised campaign to expand women's legal rights, including property rights. Many Indian men supported the cause; the majority adamantly opposed it. The question of women inheriting immovable property, especially arable land, however (as will be seen from the discussion further below), was constantly side-stepped.

The early decades of the 20th century saw an intensification of pressure for changes in women's legal status from a number of quarters, especially women's organisations and progressive male reformers.¹⁸ By 1930 several women's organisations had been founded, most notably the Women's Indian Association (WIA) in 1917, the All India Women's Conference (AIWC) in 1927, and the National Council of Women in India (NCWI) in 1925.¹⁹ These organisations worked for social reform legislation, especially on women's rights to divorce and to inherit and control property.²⁰ Forbes (1981:71) notes:

Throughout the 1930s the women's organisations formed committees on legal status, undertook studies of the laws, talked with lawyers, published pamphlets on women's position, and encouraged various pieces of legislation to enhance women's status. At first these demands were presented as part of the organisations' general efforts to uplift women, but by 1934, the AIWC passed a resolution demanding a Hindu Code that would remove women's disabilities in marriage and inheritance.

Also, among the Indian lawyers elected to the government's Central Legislative Assembly after its establishment as a legislative body in 1935 was a group of liberals concerned with social and legal reform. Attempts by the reformers, however, to introduce a number of bills, including those supporting Hindu women's right to divorce and Hindu widows' right to a share in their husbands' property, encountered strong opposition from the orthodox Indian members of the assembly. And the Hindu Women's Rights to Property Act of 1937, when finally passed, was a compromise.²¹ It gave the Hindu widow, who had previously been excluded from inheritance by the son, agnatic grandson and agnatic great-grandson of her husband, a right to intestate succession equal to a son's share in separate property among those governed by *Mitakshara*, and in all property among those governed by *Dayabhaga*. It also gave her the same interest as her deceased husband in the undivided *Mitakshara* coparcenary, with the same right to claim partition as a male coparcener, but she could hold this share only as a limited interest. Three categories of widows were recognised: the intestate's widow, the widow of a predeceased son, and the widow of a

predeceased son of a predeceased son. However, the widow's share (as noted) was only a limited estate which she could enjoy during her lifetime, after which it went to her deceased husband's heirs; it was subject to forfeiture on remarriage; and, most importantly, it explicitly excluded agricultural land on the ground that after the 1935 Act agricultural property came under provincial jurisdiction.²² Also daughters were excluded from the purview of the act.

In 1941 the government set up the Rau (Hindu Law) Committee to suggest how the Hindu Women's Rights to Property Act of 1937 should be amended, especially to clarify the nature of rights conferred by it upon the widow and to remove any injustice done by it to the daughter. Noting the Act's many technical defects and ambiguities which could lead to varying interpretations of women's rights, the committee felt that any attempt at piecemeal amendment would raise 'all the controversies latent in the Act' [GOI 1941:23]. Instead it strongly recommended that a complete code of Hindu law be prepared, beginning with the law of inheritance and followed by the law of marriage and other aspects of Hindu law. The code, as envisaged by the committee, would be one 'which... recognise[d] that men and women are equal in status with appropriate obligations as well as rights' [GOI 1941:24].

In January 1944 the government reconstituted the Rau Committee, this time for preparing a Hindu Code. AIWC carried out a countrywide campaign in favour of codification and submitted a draft memorandum to the committee. In August of the same year, the committee came out with a Draft Code. Its main provisions were [GOI 1947]: abolition of the *Mitakshara* right by birth and principle of survivorship; equal property shares for the sons and widow of the deceased, and half the sons' shares for the daughters in all intestate inheritance; an absolute estate for the widow (as opposed to a limited interest); introduction of monogamy as a rule; and legalisation of divorce under certain circumstances. Once again, however, women's succession to agricultural land was excluded from the scope of the Draft Code on the familiar ground that this issue fell within the purview of the provinces.

There were 'black flag' demonstrations opposing the Code in five cities. Reactions from women were mixed: the AIWC supported the Draft Code, while advocating equal inheritance for sons and daughters. The NCWI, several other women's groups, especially from Bombay and Calcutta, as well as many individual women (including a number of advocates) also supported the Code. But women in orthodox associations such as the All India Hindu Women's Conference opposed it. Among men,

although some supported the Code, the majority (including prominent lawyers and pandits) argued against it on grounds such as: abolishing the *Mitakshara* would adversely affect commercial enterprise; the divorce provisions would undermine the family; women were incapable of managing property and were likely to be duped by male relatives if given an absolute estate; married daughters already received a share as dowry and unmarried daughters only needed maintenance and provision for their marriage expenses; and so on. Only a small percentage of those whose views were recorded by the Second Rau Committee were women or women's organisations, but the gender divergence in those views was marked. As seen from Table 1, 71 per cent of the women (or women's organisations) and only 35 per cent of the men (or organisations other than women's organisations) supported the Bill. Support did not mean agreement with all the provisions in the Draft Code, and on specific clauses the gender gap was equally glaring.

Despite the strong opposition, the Rau committee submitted a revised draft of the Hindu Code Bill (HCB) which was introduced in the legislative assembly in April 1947, four months before India became independent. In April 1948, a further revised Hindu Code Bill was introduced in the new parliament and was again the subject of intense debate. While the AIWC continued to campaign actively for the Bill, its constituency was drawn largely from the literate, urban population, as it had been before independence. This left the Bill vulnerable to the opposition labelling it as an elite demand. One Congress legislator from West Bengal, who was especially vociferous in his opposition, characterised those supporting the Bill as "a few ultra-modern persons who are vocal, but have no real support in the country", and implied that only women of "the lavender, lipstick and vanity bag variety" were interested in the Bill.²³ He argued: "[If the daughter inherits] ultimately the family will break up" and queried "Are you going to enact a code which will facilitate the breaking up of our households?" [GOI 1949:1011]. In September 1951, of the legislators who spoke on the Bill 10 supported it and 19 opposed it [Everett 1979:172]. Most top Congress leaders of independent India were against the Bill, including the home minister, Vallabhbhai Patel, and president Rajendra Prasad.

As is now well known, in the face of such opposition prime minister Jawaharlal Nehru, although committed to the bill, shelved it in 1951. B R Ambedkar, law minister and framer of India's Constitution, resigned in protest. However, after 1951, riding on the strength of a Congress electoral victory, Nehru finally won passage for the important aspects of the Hindu Code Bill in four separate

Acts.²⁴ Of these, the Hindu Succession Act of 1956 forms the basis of Hindu succession laws today.

Everett (1979:166-67) provides some interesting insights into the contrasting images of the ideal Hindu woman that the supporters and opponents of the Bill appeared to hold:

From the [1940s and 1950s] debates [on the Hindu Code Bill] two different images of ideal Hindu women emerged. The opponents' image resembled the view of women presented in the *Manusmriti*: she needed the protection of men during all the periods of her life (thus never capable of independently looking after property), and in this position of dependence she was worshipped as a goddess. The proponents' image of the ideal Hindu woman was a competent, autonomous human being interacting with others on the basis of equal rights and individual freedom. This image stemmed from western liberal thought, however imperfectly it had been achieved in practice in the west.

The HCB opponents believed that the interests of men and women were better served when women occupied a dependent position and men and women played different social roles. The HCB supporters believed that everyone's interests were better served when men and women were independent and enjoyed equal rights... The HCB supporters operated within the equal rights perspective which had emerged as the dominant women's movement ideology since the 1930s.

Women's organisations also mobilised to win constitutional guarantees in the area of personal law. In 1945 while the Rau committee's draft Hindu Code was being discussed around the country, a new Constitution was being drafted by the constituent assembly. Hansa Mehta, in her presidential address to the AIWC in December 1945, formulated a 'Charter of Indian Women's Rights' advocating that equality between the sexes should be the basis of citizenship in India [Mehta 1981]. This issue again was intensely contested, since there could be possible contradictions between the proposed constitutional clause

promising freedom of religious practice and propagation (which could be read to include religiously sanctioned inequalitarian property and marriage laws), and the aim of social reform towards gender (and caste) equality. The matter was finally resolved by an explicit government statement that freedom of religion did not preclude social reform.²⁵ In practice, this issue remains a contentious one.

Indeed, in the 1950s the struggle for gender equality in property laws was by no means over, and that for ensuring women's *de facto* property rights had not even begun.

(3) HINDU PROPERTY LAWS TODAY

Today the property rights of Hindus are governed by the Hindu Succession Act of 1956 (applicable to all states other than Jammu and Kashmir²⁶ and covering about 86 per cent of the Indian population).²⁷ In the Act, 'Hindus' are defined as including Sikhs, Jains and Buddhists. However, the Act has special provisions for Hindu matrilineal communities customarily governed by the *Marumakkattayam* and *Alivasantana* systems, as well as for the Nambudiri brahmins. (Tribal communities of the northeastern states of Arunachal Pradesh, Manipur, Meghalaya, Mizoram and Nagaland are not covered by the Act, and continue to be ruled by local customs which are still, in large part, uncoded.)²⁸ The Act sought to unify the *Mitakshara* and the *Dayabhaga* systems, and purported to lay down a law of succession whereby sons and daughters would enjoy equal inheritance rights, as would brothers and sisters. In fact, significant gender inequalities remain.

Under the Act, in the case of a Hindu male dying intestate, all his separate or self-acquired property, in the first instance, devolves equally upon his sons, daughters, widow, and mother. In addition (and simultaneously with the mentioned four categories of heirs), if there is a predeceased son, his children and widow get the share he would have received if alive; the children of a predeceased daughter get her share likewise; and the children and widow of a

predeceased son of a predeceased son similarly inherit a share as representatives of the deceased in question. All these are the primary or Class I heirs under the Act.²⁹ In the absence of Class I heirs, the property devolves on Class II heirs and in their absence first on agnates and then on cognates. For joint family property, if the deceased male was earlier governed by the *Dayabhaga* system the same rules of succession as relate to other types of property apply to this as well.

However, for those previously governed by *Mitakshara* law, the concept of *Mitakshara* coparcenary property devolving by survivorship continues to be recognised with some qualifications: in the case of a male who has an interest in *Mitakshara* coparcenary at the time of his death and who leaves behind Class I female heirs, or male relatives specified in Class I as claiming through Class I female heirs, his interest devolves not according to the *Mitakshara* principle of survivorship but according to the 1956 Act; and his share in the joint property and hence the shares of his heirs are ascertained under the assumption of a 'notional' partition (that is, as if the partition had taken place just prior to his death). If the deceased does not leave behind Class I female heirs or male heirs claiming through such female heirs, the devolution is according to the *Mitakshara* rules. Either way this does not affect the *direct* interest in the coparcenary held by male members by virtue of birth; it affects only the interest they may hold in the share of the deceased.

In the case of a Hindu woman dying intestate, if she has children or grandchildren from predeceased children, all her property in the first instance devolves equally upon her sons, daughters, children of predeceased children, and husband. If she has no living children and no grandchildren from predeceased children, the property devolution differs according to the source of acquisition: that inherited from her parents goes to her father's heirs; that inherited from her husband or father-in-law (as a widow of a predeceased son) goes to the husband's heirs; and that acquired in ways other than these passes to her husband, and failing him to his heirs.

Under the Act, all female heirs have absolute ownership and full testamentary rights over all property, not just a limited interest in it. The Act also gives unrestricted testamentary rights to males in their separate or self-acquired property, as well as in their share of the joint family property; but in relation to ancestral agricultural land there are restrictions on the testamentary rights of males in some states, by virtue of custom, as in Punjab.³⁰

For Hindus customarily governed by the *Marumakkattayam* and *Aliyasantana* systems, under the special provisions of the

Act the devolution of property is somewhat different, especially in relation to the intestate inheritance of women's property [Agarwal 1994, for details].

Since the passing of the Hindu Succession Act, some states have enacted laws affecting joint family property. For instance, the Kerala Joint Hindu Family System (Abolition) Act of 1976 deemed all family members with an interest in the Hindu undivided family estate as holding their shares separately as full owners from then onwards. This Act struck a final blow to the remnants of matrilineal joint estates, but also eliminated any advantages that sons enjoyed over daughters in joint family property among patrilineal Hindus in Kerala. Subsequently, Andhra Pradesh in 1986, Tamil Nadu in 1989, and Maharashtra in 1994, amended the Hindu Succession Act to recognise unmarried daughters (that is, daughters who were unmarried when these amendments came into force) as coparceners by birth in their own right, giving them claims equal to those of sons in joint family property, including the right to a share by survivorship.³¹ However, these amendments (in Andhra Pradesh, Tamil Nadu and Maharashtra) do not reduce discrimination in relation to daughters married prior to the commencement of the amendment Acts.

Also, in states other than these, the 1956 Hindu Succession Act, as originally enacted, continues to be in force, having reduced but not eliminated pre-existing gender inequalities among customarily patrilineal Hindus, as discussed below.

II

Persisting Gender Inequalities and Anomalies: Hindu Inheritance Laws and Land Reform Laws

(1) PERSISTING GENDER INEQUALITIES

Several major sources of gender inequality remain in the Hindu Succession Act of 1956: (i) Since the concept of the *Mitakshara* joint family succession continues to be recognised (except in Kerala), some of the basic gender inequalities inherent in relation to coparcenary property persist in most states. These inequalities (as applicable to states other than Andhra Pradesh, Tamil Nadu and Maharashtra),³² relate especially to the following:

- Since only males can be coparceners in the joint family property, sons have an indefeasible right in such property, but daughters don't. In addition, sons have a right to succeed to the deceased father's share of the coparcenary if the father dies intestate. Daughters have only the latter right, that is the right to succeed to the father's share of the coparcenary.
- A coparcener can renounce his rights in the coparcenary property. In such cases

his sons would continue to maintain their independent rights to the coparcenary, but daughters and other Class I female heirs would lose the possibility of benefiting from such property. Similarly, after partition, the father can make a gift of his share in the coparcenary property to his sons, thereby defeating the rights of female heirs.

- A man can convert his separate or self-acquired property to coparcenary property, in which case his daughters, widow and mother, who would otherwise have enjoyed equal shares with his sons in such separate and self-acquired property, lose out.
- Unlike sons, married daughters (even if facing marital harassment) have no residence rights in the ancestral home. And while daughters who are unmarried, separated, divorced, deserted, or widowed do have residence rights, they cannot demand partition if the males do not choose to partition.

(ii) The children of a predeceased daughter of a predeceased daughter do not figure among the Class I heirs, while the children of a predeceased son of a predeceased son do.

(ii) The right to will away property is not restricted: a man has full testamentary power over all his property, including his interest in the coparcenary. In principle the provision is gender-neutral, but in practice it can be and often is used to disinherit females.³³

(iv) Although the Act covers owned agricultural land, certain other types of interests in agricultural land, such as those stemming from 'tenancy rights', are exempted. Section 4(2) of the Act provides that:

...nothing contained in this Act shall be deemed to affect the provisions of any law for the time being in force providing for the prevention of fragmentation of agricultural holdings or for the fixation of ceilings or for the devolution of tenancy rights in respect of such holdings.

The gender implications of this exemption are crucial to the present discussion, as elaborated below.

(2) ANOMALIES RESULTING FROM EXISTING LAND LEGISLATION

Two factors in particular have led to a disjunction between women's legal rights in property in general, and their rights in agricultural land. First, legislative powers are divided between the union and provincial (now termed state) legislatures under the principle of Federalism; and on enactments relating to agricultural land the state governments continue to have considerable legislative powers. Thus legislation affecting women's rights in certain categories of agricultural land varies by state, reflecting regional differences in social attitudes and

in legal approaches and histories. Second, landreform policies (land to the tiller, fixation of ceilings, prevention of fragmentation, etc) have been based both on the principle of redistributive justice and on arguments regarding efficiency; but on neither count are gender inequalities taken into account.

The Government of India Act 1935 vested all legislative powers in relation to agricultural land exclusively in the provincial (state) legislatures. Thenceforth women's inheritance rights in agricultural land depended on the land-related laws prevailing in the province in which the land was located, whatever being the laws governing other forms of property. Hence, for instance, the Hindu Women's Right to Property Act 1937 (as noted) did not apply to agricultural land. And although a few provinces (mentioned earlier) subsequently extended the Act to cover agricultural land, the extension left unaffected any rule of succession that related to a tenant's rights in agricultural land by any special law then in force.

Since independence, state legislatures have continued to enjoy the power to enact land laws, but subject to some restrictions. Under the Constitution of India adopted in November 1949, if the state legislature wants to modify any laws on topics which have been included in the "concurrent list" of the Constitution, and which have already been enacted by parliament, the modifications need the assent of the president of India. The Hindu Succession Act (HSA) of 1956 is one such piece of legislation. Hence if states want to pass laws modifying the Hindu succession rules for owned agricultural land, this will need the president's consent. However, state legislatures can continue to enact laws relating to tenancy rights, ceiling laws, etc (which, as noted, were excluded from the purview of the HSA), without needing such assent. What this has meant is that women's legal rights in agricultural land still show a vast disparity by region, especially in relation to (a) devolution rules for land deemed to be under 'tenancy'; and (b) rules regarding the fixation of ceilings and the forfeiture of surplus land above the ceiling limit, as discussed below.

(A) DEVOLUTION OF AGRICULTURAL LAND UNDER 'TENANCY'

Tenancy rights in agricultural land, as noted, were specifically exempted from the Hindu Succession Act of 1956. As a result, there is today a major disjunction in several states between state land enactments affecting the devolution of certain categories of agricultural land and the personal laws affecting the devolution of all other property, on at least two counts. First, in a number of states the succession rules relating to land held under tenancy have a different order of devolution than the personal laws

specify. For example (as seen from Table 2), in the tenurial laws of Haryana, Himachal Pradesh, Jammu and Kashmir, Punjab, Delhi and Uttar Pradesh (all located in northwest India), the specified rules of devolution show a strong preference for agnatic succession, with a priority for agnatic males. In all these states the tenancy devolves in the first instance on male lineal descendants in the male line of descent. The widow inherits only in the absence of these male heirs.³³ In addition, in the first four states mentioned, daughters and sisters are totally excluded as heirs. In Delhi and Uttar Pradesh, daughters and sisters are recognised but come very low in the order of heirs. Moreover, in all these six states, a woman (in any capacity) can hold only a limited interest in the land, in that after her death the holding goes not to her heirs but to the heirs of the last male landowner. She also loses the land if she remarries or abandons the land (that is, fails to cultivate it for a specified period, usually a year or two).

States where the tenurial laws explicitly mention that the devolution of tenancy land will be according to personal law are very few, and include Rajasthan and Madhya

Pradesh where the personal law applies for all communities (Table 2). Also in the Telangana region of Andhra Pradesh, the commentary following Section 40 of the relevant Act clarifies that for Hindu tenants the Hindu Succession Act will apply.³⁴ In practice, however, even in Rajasthan daughters have been recognised as heirs only in some judgments, while in others male heirs alone have received recognition.³⁵ In addition, as seen from Table 2, there are states which do not specify the order of devolution in their laws dealing with tenancy land, such as Gujarat, the Bombay region of Maharashtra,³⁶ West Bengal, Karnataka, Kerala, the Andhra region of Andhra Pradesh, and Tamil Nadu. In these states we can presume that the personal laws automatically apply. Then there are states such as Bihar and Orissa for which the tenancy acts specify that occupancy rights shall devolve in the same manner as other immovable property, "subject to any custom to the contrary".³⁷ This leaves open the possibility of admitting gender-inegalitarian customs if established, especially for the tribal communities in these regions, although the Supreme Court order in the case of 'Madhu Kishwar and others

TABLE 2: DEVOLUTION OF AGRICULTURAL TENANCIES IN LAND ENACTMENTS, BY STATE

State	Agricultural Tenancies: First Order Heirs	Relevant Act
<i>Northwest India</i>		
Delhi ¹	Male lineal descendants in the male line of descent	The Delhi Land Reforms Act, 1954 (Act No 8 of 1954)
Haryana	Male lineal descendants in the male line of descent	The Punjab Tenancy Act 1887 (Act No 16 of 1887), amended up to 1969; and the Pepsu Tenancy and Agricultural Land Act 1955 (Pepsu Act 13 of 1955)
Himachal Pradesh	Male lineal descendants in the male line of descent	The Himachal Pradesh Tenancy and Land Reform Act 1972 (Act No 8 of 1974)
Jammu and Kashmir	Male lineal descendants in the male line of descent	The Jammu and Kashmir Tenancy Act 1980 (Act No 2 of 1980)
Punjab	Male lineal descendants in the male line of descent	The Punjab Tenancy Act 1887 (Act No 16 of 1887), amended up to 1969; and the Pepsu Tenancy and Agricultural Land Act 1955 (Pepsu Act 13 of 1955)
Rajasthan	Personal law applies	The Rajasthan Tenancy Act 1955 (Act No 3 of 1955)
Uttar Pradesh ¹	Male lineal descendants in the male line of descent	The Uttar Pradesh Zamindari Abolition and Land Reforms Act, 1950 (UP Act No 1 of 1951), amended up to 1987
<i>East, west and central India</i>		
Bihar	No specification of the order of devolution; but the tenancy laws state that the devolution of occupancy rights shall be in the same manner as other immovable property, unless custom to the contrary is established	The Bihar Tenancy Act 1885 (Act No 8 of 1885) amended up to 1987; and The Chota Nagpur Tenancy Act 1908 (Bengal Act No 6 of 1908)
Gujarat	No specification of the order of devolution; can be presumed that the personal law applies	The Bombay Tenancy and Agricultural Lands Act, 1948 (Act No 67 of 1948)
Madhya Pradesh	Personal law applies ²	The Madhya Pradesh Land Revenue Code, 1959 (Act No 20 of 1959), as amended in 1961

(Contd)

vs the State of Bihar and others' (SCC 102, Part 1, 1992) suggests that the legal validity of such discriminatory customs is now open to question.³⁴

Second, although most states in their land reform laws dealing with owned land do not mention the order of devolution at all,³⁹ some states define 'tenants' in very broad terms so that the category effectively includes interests arising out of all agricultural land, as is the case in Uttar Pradesh and Delhi. For instance, under the Uttar Pradesh Zamindari Abolition and Land Reforms Act 1950, the devolution rules mentioned above, which favour male lineal descendants, apply to various categories of cultivators: 'bhumidhars', 'sirdars' and 'asamis'.⁴⁰ Over time, according to the Statement of Objects and Reasons in the Act, "it is expected that the vast majority of cultivators will become bhumidhars". *Bhumidhars*, however, are persons liable to pay land revenue to the government and not rent. Counting them as tenants and exempting them from the provisions of the Hindu Succession Act means that most agricultural land in Uttar Pradesh, a state which contains one-sixth of the country's population, is legally inheritable principally by males. In the Delhi Land Reforms Act 1954 (Act No 8 of 1954), likewise the specified order of devolution (which, as noted, favours male agnates) applies to both *bhumidars* and *asamis*.

Gender inequalities also arise from land reform enactments relating to the fixation of ceilings. (This part of the discussion is equally relevant for non-Hindu communities in India.) The enactments are characterised by certain general features as follows. A ceiling is fixed in relation to a family unit consisting of up to five members. Additional land is, however, allowed to families of over five members, subject to a specified maximum. In addition, in most states adult sons get special consideration (as elaborated shortly). Also, usually where the husband counts as a unit the wife cannot count as an independent unit even where she owns land in her own right. In these enactments, gender inequalities and anomalies arise on at least three counts: one, in the definition of 'family'; two, in the additional allotments for adult sons but not adult daughters; and three, in not allowing the wife to be counted as an independent unit where the husband is counted as one.

The definition of 'family' varies widely across states. For instance (as seen from Table 3), in Delhi, Haryana, Punjab, Rajasthan, Uttar Pradesh, and Andhra Pradesh, the family is defined as constituted by the cultivator and his/her spouse, minor sons, and unmarried minor daughters.⁴¹ In

2 When initially passed, the Madhya Pradesh Land Revenue Code of 1959 specified an order of devolution wherein the Class I heirs (for both owned and tenancy land) were as follows: son; widow (or widower); predeceased son and widow; son and widow of predeceased son's predeceased son; and widow of predeceased son's predeceased son's predeceased son. Since the 1961 amendment, however, devolution is according to personal law for the lands of both tenure holders and occupancy tenants.

Since the HSA had already been passed in 1956, that is prior to this Tenancy Act, I am taking the view that even for Hindu tenants who are not occupancy tenants, the HSA would apply (with the relevant provisions with respect to survivorship applying if the tenant was a member of an undivided Hindu family).

4 See note 34 in the text.

Bihar, Himachal Pradesh, and Madhya Pradesh it includes the cultivator, his/her spouse and minor children; in Tamil Nadu it includes the cultivator and his/her spouse, minor sons, unmarried daughters, and orphaned minor grandsons and orphaned unmarried granddaughters in the male line of descent. In Kerala it includes the cultivator, his/her spouse and unmarried minor children.

Moreover, in virtually all the states, adult sons (as noted) receive special consideration. For instance, in Delhi, Haryana, Punjab, and Uttar Pradesh, the parental household can hold additional land on account of each adult son, subject to a specified maximum.⁴² In several other states such as Himachal Pradesh, Rajasthan, Bihar, Gujarat, Madhya Pradesh, Maharashtra, Andhra Pradesh, and Tamil Nadu, each adult son counts as a separate unit and is entitled to hold a specified extent of land in his own right. Only in Kerala do both the unmarried adult son *and* the unmarried adult daughter count as separate units.

In these enactments, therefore, with the exception of a few states such as Jammu and Kashmir, West Bengal, Karnataka, Kerala and Tamil Nadu, unmarried adult daughters receive no recognition at all: they do not count either as part of the family unit or as separate units; and in a number of states such as Delhi, Haryana, Punjab, Rajasthan, Uttar Pradesh, and Andhra Pradesh, married minor daughters also receive no recognition.

Underlying the ceiling specifications is clearly the assumption that those who are recognised either as part of the family unit or separately (as with adult sons) will be maintained by the land allowed within the ceiling regulations. Under these enactments we thus have an extraordinary situation where most states did not give any consideration, when fixing ceilings, for the maintenance needs of unmarried adult daughters and married minor daughters, while giving consideration to all sons, whatever their age or marital status. And, as noted, in most states adult sons receive special recognition in that their parents, or they themselves, are entitled to additional land, while adult daughters receive no such recognition.

Although in a state such as Uttar Pradesh, it is the tenure holder who is allowed additional land on account of adult sons rather than the sons themselves, given the land devolution rules prevailing there, any such land will ultimately pass to the sons. Even if we were to assume that married daughters would be taken into account in their marital homes, the land ceiling rules along with the devolution rules in the state leave the unmarried adult daughter out in the cold, as they do daughters whose marriages break down. The situation in Delhi, Haryana, Himachal Pradesh, and Punjab is analogous.⁴³

In 1971, following the 1970 Conference of Chief Ministers on Land Reforms, a

Central Land Reforms Committee was constituted under the chairmanship of the union agricultural minister. It recommended, among other things, that the definition of the family should be made uniform across the states and include a man and his wife and minor children, with additional land being allowed for extra members in excess of five, up to a maximum of twice the ceiling limit for the family of five members. A high-powered committee set up to review these recommendations disagreed with them and suggested that the ceiling should be applied to a family of five, consisting of a man and his wife and three children (major or minor), including any major sons. However, the Chief Ministers' Conference on Ceiling on Agricultural Holdings, held in July 1972, drawing its guidelines from the recommendations of both the above committees, laid down (among other things) that a family should be defined as including a man, his wife, and minor children, and additional land should be granted for members in excess of five, up to a maximum of twice the ceiling limit set for a family of five members. Further, each major son should be treated as a separate unit. In other words, the guidelines incorporated gender-inequitable rules.⁴⁴ And the situation, as it stands today, continues to be one where there is no uniformity across states on these counts and most states continue to have gender-discriminatory ceiling laws.

Over the years, some of these ceiling Acts have been challenged (unsuccessfully) in court, one of the grounds for challenging them being that they discriminated against women and were therefore unconstitutional.⁴⁵ However, the First Amendment to the Constitution of India, enacted in 1951, had introduced a device to protect the validity of land reform legislation. Under Article 31b it provided that none of the Acts mentioned in the Ninth Schedule of the Constitution [listed in GOI 1990] could be deemed to be void on the ground that they infringed on the fundamental rights granted by the Constitution of India. Virtually all the noted ceiling laws are included in the Ninth Schedule. This provision provides a basis for dismissing pleas challenging the ceiling laws on various grounds, including grounds of gender discrimination.⁴⁶ The Andhra Pradesh Land Reforms (Ceiling on Agricultural Holdings) Act 1972, in fact, explicitly mentions in its Explanation to Section 4(3): "The constitutionality of discriminating against unmarried [major] daughters cannot be questioned as the Act is now included in the Ninth Schedule to the Constitution".

The judgment that was delivered when The Uttar Pradesh Zamindari Abolition and Land Reforms Act 1950 was challenged in the Supreme Court in 1980 is also noteworthy for its comments on the gender aspects of

the Act.⁴⁷ Among the grounds for the challenge were that it discriminated against major unmarried daughters by not providing extra land to their father as it did for adult sons; and that it discriminated against wives in the fixation of ceilings, by regarding the husband as the tenure holder even when the wife was the owner. Justice Krishna Iyer (although reputed to be an advocate of women's rights) rejected the pleas in his judgment. He stated: "no submission to destroy this measure can be permitted using sex discrimination as a means to sabotage what is socially desirable" (p 729). While admitting that the advantage granted to major sons and not to daughters was discriminatory, he nevertheless justified the rule on the ground that in effective terms the entire land goes to the father as the tenure holder (and not to the son) "for feeding this extra mouth" (p 729). Presumably adult daughters don't need to be fed!

Moreover, the Act's exclusion of women as tenure holders where their husbands are also tenure holders was explained away in the judgment as "a legislative device for simplifying procedural dealings", and the judgment stated that: "When all is said and done, married women in our villages do need their husbands' services and speak through them in public places" [SCC 1980:730]. Underlying these justifications was clearly a prioritising of class interests at the cost of gender interests: "large land holders [cannot] be allowed to outwit socially imperative land distribution by putting female discrimination as a mask" [SCC 1980:730]. Ironically, the land reform programme of the government was not successful even in significantly redistributing land between households.⁴⁸

Another source of gender inequality relates to the assessment of ceiling surplus land. The holdings of both spouses (if the wife too has land in her name) are typically aggregated in assessing 'family land'. Some guidelines on how the amount to be forfeited by both spouses was to be calculated, were laid down at the earlier-mentioned Chief Ministers' 1972 Conference on Ceilings on Agricultural Holdings. The guidelines specified that "where both the husband and wife hold lands in their own names, the two will have rights in the properties within the ceiling in proportion to the value of the land held by each before the application of [the] ceiling" [GOI 1976:41]. Also, in the ceiling legislation of some south Indian states, land in the names of female family members receives some protection, and in Tamil Nadu it is given special and favourable treatment.⁴⁹

In practice, however, there has been considerable arbitrariness in deciding how much of whose land would be declared surplus and forfeited. Often the husband alone has been consulted in this matter. This has been known to lead to the wife's land

TABLE 3: DEFINITION OF FAMILY AND TREATMENT OF ADULT SONS IN LAND CEILING LAWS

State	Definition of Family	Treatment of Adult Sons	Relevant Act
Northwest India			
Delhi	Cultivator, spouse, minor sons, unmarried minor daughters	Family gets additional land	The Delhi Land Holdings (Ceiling) Act 1960 (Act No 24 of 1960)
Haryana	Cultivator, spouse, minor sons, unmarried minor daughters	Family gets additional land if son is living with parents; son counts as separate unit if living separately	Haryana Ceiling on Holdings Act 1972 (Haryana Act No 26 of 1972), as amended up to 1976
Himachal Pradesh	Cultivator, spouse, minor children	Separate unit (if son is dead, his widow and children receive the same consideration)	Himachal Pradesh Ceiling on Land Holdings Act 1972 (Act No 19 of 1973)
Jammu and Kashmir	Cultivator, spouse, minor sons, unmarried daughters, some major sons ¹	---	Jammu and Kashmir Agrarian Reforms Act 1976 (Act No 17 of 1976)
Punjab	Cultivator, spouse, minor sons, unmarried minor daughters	Family gets additional land	The Punjab Land Reforms Act 1972 (Punjab Act No 10 of 1973)
Rajasthan	Cultivator, spouse, minor sons, unmarried minor daughters	Separate unit (if son is dead his widow and children receive the same consideration)	Rajasthan Imposition of Ceiling on Agricultural Holdings Act 1973 (Rajasthan Act No 11 of 1973)
Uttar Pradesh	Cultivator, spouse, minor sons, unmarried minor daughters	Family given additional land, and if the son is dead his minor sons or unmarried minor daughters (who are not tenure holders themselves or who hold <2 ha irrigated land) receive the same consideration	The Uttar Pradesh (Imposition of Ceiling on Land Holdings) Act 1960 (Uttar Pradesh Act No 1 of 1961), as amended up to 1976
East, west and central India			
Bihar	Cultivator, spouse, minor children	Separate unit	Bihar Land Reforms (Fixation of Ceilings and Acquisition of Surplus Land) Act 1961 (Bihar Act 12 of 1962)
Gujarat	Cultivator, spouse, minor sons, unmarried minor daughters, widow of predeceased son, orphaned minor grandson and unmarried granddaughter in the male line	Separate unit	The Gujarat Agricultural Lands Ceiling Act 1960 (Gujarat Act No 27 of 1961), as amended up to 1974
Madhya Pradesh	Cultivator, spouse, minor children	Separate unit	Madhya Pradesh Ceiling on Agricultural Holdings Act, 1960 (Act No 20 of 1960), as amended up to 1976
Maharashtra	(1) Cultivator, spouse, minor sons, unmarried minor daughters; or (2) Hindu undivided family	Separate unit	The Maharashtra Agricultural Lands (Ceiling on Holdings) Act 1961 (Act No 27 of 1961) as amended up to 1975
Orissa	Cultivator, spouse, children, except major married sons separated before September 26, 1970. In relation to mother, family includes married daughters	---	The Orissa Land Reforms Act 1960 (Orissa Act No 16 of 1960)
West Bengal	Cultivator, spouse, minor sons, unmarried daughters, and some adult sons and their families ²	---	The West Bengal Land Reforms Act 1955 (West Bengal Act No 10 of 1956), as amended up to 1986
South India			
Andhra Pradesh	Cultivator, spouse, minor sons, unmarried minor daughters	Separate unit	Andhra Pradesh Land Reform (Ceiling on Agricultural Holdings) Act 1973 (Act No 1 of 1973)
Karnataka	Cultivator, spouse, minor sons, unmarried daughters	---	Karnataka Land Reforms Act 1961 (Act No 10 of 1962), as amended up to 1980
Kerala	Cultivator, spouse, unmarried minor children	Unmarried adult sons, and unmarried adult daughters counted as separate units	Kerala Land Reforms Act 1963 (Act No 1 of 1964)
Tamil Nadu	Cultivator, spouse, minor sons, unmarried daughters; and orphaned minor grandsons and orphaned unmarried granddaughters in the male line	Separate unit	The Tamil Nadu Land Reforms (Fixation of Ceiling on Land Holdings) Act 1971 (Act No 58 of 1961)

Notes: 1 It excludes major sons separated from the father on or before September 1, 1971 and holding land separately in their own names.

2 In West Bengal, the family unit is defined as including the following categories of adult sons and their families: (1) unmarried adult son who does not hold land as a raiyat; (2) married adult son where neither he nor his wife or minor son or unmarried daughter hold land as raiyats; (3) the widow of a son where neither the widow nor her minor son or unmarried daughter hold land as raiyats; and (4) minor son or unmarried daughter of a deceased son and his deceased wife, where the parents did not hold land as raiyats and the children too do not hold land as raiyats. Also an adult unmarried man or woman who has been divorced and has not remarried counts as a separate unit, provided such a person is the guardian of a minor son or an unmarried daughter, or both.

being forfeited without her having a say in the matter, causing her to lose her primary or only source of economic independence. Given that so few women in any case have land in their own names, this practice has compounded existing gender inequalities in land rights. In Kerala, for instance, when ceiling surplus land was being assessed under the land reforms programme in the late 1950s, many women asked that they be allowed to retain their property where their husbands had independent regular sources of income. But the demand went unheeded [Saradamoni 1983].

Cases in which the wife has been able to establish her claim are rare. One such was a 1986 court case in Orissa, in which the government revenue officer, in assessing ceiling surplus land, aggregated the land of both spouses as 'family land', including land separately registered in the wife's name and inherited from her father. But he gave notice only to the husband as the 'person interested'. The two men settled the matter between them, and the wife's land was declared surplus. The wife appealed to the high court, asking that her separate land be excluded from the ceiling surplus, on the ground that since the land concerned was her separate property she was the 'person interested' to whom prior notice should have been given. This, she argued, would have given her a chance to ask the revenue officer to let her retain her land and instead declare part of her husband's land as surplus. Her appeal was accepted by the court under the constitutional principle of 'natural justice'.⁵⁰

Over the years there have also been explicit attempts by some states to amend the Hindu Succession Act of 1956 in such a way as to legally exclude daughters from inheriting agricultural land. For instance, in 1969, in a bill which came before the Punjab legislative assembly, it was argued that daughters should not have a legal share in agricultural land (as allowed under the Hindu Succession Act) because it would cause fragmentation and because they got a dowry anyway. This was strongly opposed by women in the state. Tara Ali Baig, then president of AIWC, pointed out that fragmentation took place even when sons inherited, and that dowry had been legally prohibited since 1961 [Mies 1980]. The bill was not passed. Other (unsuccessful) attempts in this direction have been made subsequently. For instance, around 1979 the Haryana legislature sought to amend the Hindu Succession Act so as to deprive daughters of rights in agricultural property, but the president of India refused his assent to the amendment.⁵¹

Moreover the special consideration given to major sons in fixing land ceilings under the land reform enactments is being replicated in land resettlement schemes. For instance, in Gujarat, farming families displaced by the

Narmada Valley dam project have been promised (at the resettlement site) two hectares for each adult son, in addition to the two hectares for the family unit as a whole, but nothing for adult daughters. This is not only gender-discriminatory but also implicitly biased against families with no adult sons. As some of the displaced tribals at the dam site asked me in 1992: "What about those of us who have only adult daughters? Don't we have to feed them?" This project, the largest river valley project in south Asia, has been a focus of national and international controversy and agitation, especially around the issue of resettlement. The terms of resettlement established here are likely to set a precedent for future projects involving displacement, making it even more imperative to correct the gender bias in this scheme.⁵²

In general, there is a strong case for re-examining and amending the existing land-related laws across the country to ensure uniformity and gender equality in rights to this critical economic resource. For a start this would mean eliminating existing gender inequalities on at least two counts: (a) in the land ceiling laws, and (b) in the devolution rules relating to all agricultural land (whether under tenancy or otherwise).

III

Laws Governing Christians and Parsis Today

The 1956 Hindu Succession Act (as noted) covered Sikhs, Buddhists, and Jains under the definition of 'Hindu' but excluded Indian Christians, Parsis, and other minority

communities. The laws pertaining to Christians and Parsis in India are briefly outlined below, and some of these also have been challenged on grounds of gender inequity.

(1) THE CHRISTIANS

The laws for Christians (who constituted 2.4 per cent of India's population in 1981) vary according to domicile for all movable property and by location of property in the case of immovables. For instance, Christians from Goa are governed by the Portuguese Civil Code; those from Cochin and Travancore (Kerala) until recently by the Cochin Christian Succession Act of 1921, and the Travancore Christian Succession Act of 1916, respectively; those in Punjab, Haryana and Himachal Pradesh by the customary laws of Punjab;⁵³ the Christian tribal populations of northeast India also by their customary laws; and the rest by the Indian Succession Act (ISA) of 1925, discussed further on.

Both the Cochin and the Travancore Acts contained significant gender inequalities. Under the Travancore Act, for example, a widow or mother inherited only a life interest in land and other immovable property, which too had to be forfeited on remarriage; and a daughter received 'stridhan' which was fixed at one-fourth the value of the son's inheritance share of Rs 5,000, whichever was less. Under the ISA of 1925 (Section 33), however, if a man dies intestate leaving lineal descendants, his widow gets one-third of his estate, while sons and daughters get equal shares in the rest. If there are no lineal

TABLE 4: SUMMARY TABLE*
(Agricultural land over which male lineal descendants in the male line of descent have priority under presently applicable rules of devolution: by state and religious group)

(Contd)

TABLE 4: (Contd)

Notes: * This table needs to be read in conjunction with Table 2 and the discussion in the text of this paper.

- PL In these states, devolution is legislatively stated to be, or can be inferred to be, according to personal law for all agricultural land [viz, the HSA for Hindus, the Shariat for Muslims, and the relevant legislation for Parsis and Christians (as detailed in the text of this paper)]. Also see the relevant notes in each instance.
- 1 No specification of the order of devolution in the tenancy laws, but the laws state that devolution of occupancy rights shall be in the same manner as other immovable property, unless custom to the contrary is established. However, the Supreme Court ruling in the case of 'Madhu Kishwar and others vs the State of Bihar and others' (SSC 102, Part I, 1992), suggests that the legal validity of gender discriminatory customs is now open to question (for details see text and note 38 of this paper).
 - 2 No specification of devolution rules in tenancy or other land reform legislation; hence it can be inferred that devolution is according to the HSA for all agricultural land.
 - 3 For the Bombay region, there is no specification of devolution rules in tenancy or other land reform legislation; for other regions, tenancy legislation suggests that the HSA will apply (see explanatory note No 3 in Table 2).
 - 4 No specification of devolution rules in tenancy or other land reform legislation; hence it can be inferred that devolution is according to the HSA for all agricultural land.
 - 5 HSA applies to owned land in the whole of Andhra Pradesh, as well as to tenancy land in the Telangana area; there is no specification of devolution rules for tenancy land in tenancy legislation for the Andhra area. Hence it can be inferred that devolution is according to the HSA for all agricultural land in the whole of Andhra Pradesh.
 - 6 No specification of devolution rules in tenancy or other land reform legislation; hence it can be inferred that devolution is according to the HSA, with the Act's special provisions being applicable to the patrilineal Nambudiri Brahmins and the matrilineal communities of the state.
 - 7 No specification of devolution in tenancy or other land reform legislation; hence it can be inferred that devolution is according to the HSA for all agricultural land.
 - 8 Custom favouring male lineal descendants has always been strong in these states; also (as noted in Table 2) devolution rules favouring male lineal heirs are clearly specified in the tenurial laws of these states. Unlike the HSA, however, which exempts essentially 'tenancy rights' from the purview of the Act, the 1937 Shariat Act exempts all agricultural land from its purview.
 - 9 For tenancy land, tenancy legislation specifies devolution rules favouring male lineal descendants. For owned land, personal law applies unless custom to the contrary is established [see Section 4 of The Sri Pratap Jammu and Kashmir Laws Consolidation Act 1977 (Act No 4 of 1977)].
 - 10 Personal law applies to tenancy land. Also there is no specification of the order of devolution in other land reform legislation. Hence it can be inferred that devolution is according to Shariat law for all agricultural land.
 - 11 No specification of the order of devolution in tenancy or other land reform legislation, but, as noted in Table 2, the tenancy legislation states that the devolution of occupancy rights shall be in the same manner as other immovable property, unless custom to the contrary is established. However, the Supreme Court ruling in the case of 'Madhu Kishwar and others vs the state of Bihar and others' (SSC 102, Part I, 1992), suggests that the legal validity of gender discriminatory customs is now open to question (for details see text and note 38 of this paper). Also, in Bihar there was no presumption in favour of custom even before the passing of the 1937 Shariat Act [Mulla 1990: 7-9]. Hence it can be inferred that devolution is according to the Shariat for all agricultural land.
 - 12 No specification of devolution rules in tenancy or other land reform legislation; also there was no presumption in favour of custom even before the passing of the 1937 Shariat Act [Mulla, 1990:7-9]. Hence it can be inferred that devolution is according to the Shariat for all agricultural land.
 - 13 For the Bombay region, there is no specification of devolution rules in tenancy or other land reform legislation. For the other regions, tenancy legislation indicates that for Muslims, personal law applies; also there was no presumption in favour of custom even before the passing of the 1937 Shariat Act [Mulla 1990: 8-9]. Hence it can be inferred that devolution is according to Shariat law for all agricultural land in the state.
 - 14 In the Andhra region of Andhra Pradesh, the Muslim Personal Law (Shariat) Application Act of 1937 was amended to include agricultural land. In the parts of Andhra Pradesh which were earlier in former Hyderabad state, custom at variance with Mohammedan law was not admitted even before the 1937 Shariat Act was passed [Mulla 1990:11].
 - 15 In the parts of Karnataka which were earlier in former Madras Province, the Muslim Personal Law (Shariat) Application Act of 1937 was amended to include agricultural land. In the parts of Karnataka which were earlier in former Hyderabad state, custom at variance with Mohammedan law was not admitted even before the 1937 Shariat Act was passed [Mulla 1990:11].
 - 16 Muslim Personal Law (Shariat) Application Act of 1937 was amended to include agricultural land.
 - 17 See Sivaramayya (1978); also see 'Prem Singh v Lilavati' in AIR (1956), Himachal Pradesh: 17.
 - 18 Personal law applies, unless custom to the contrary is established [Section 4 of The Sri Pratap Jammu and Kashmir Laws Consolidation Act 1977 (Act No 4 of 1977)].

descendants, but there are other kindred who are eligible to inherit, the widow gets half the estate; and in the absence of both lineal descendants and kindred, she gets the whole property.³⁴ There are no restrictions on testation.

In 1949 the former princely states of Travancore and Cochin merged to form what is termed as the Part-B state of Travancore-Cochin within the Indian Union; and in 1951 certain Acts prevailing in the rest of India became applicable to Part-B states. For Travancore-Cochin this meant that the ISA should thenceforth have applied. However, a court judgment in 1956 upheld the authority of the pre-existing Travancore-Cochin succession laws for Christians (viz. the Cochin Act of 1921 and the Travancore Act of 1916).³⁵ It was only in 1983, more than two and half decades later, that the Travancore Act of 1916 was challenged in the Supreme Court by Mary Roy, a Syrian Christian from Travancore and daughter of wealthy parents, on the ground that it violated the constitutional guarantee of equal rights for both sexes.³⁶ As a result of this petition, in 1986 the Supreme Court (although it did not address the specific issue of gender inequality) held that after the inclusion of Travancore and Cochin in the Indian Union, the relevant law governing Christians in those regions was the ISA of 1925. By this judgment, therefore, the Travancore Christian Succession Act of 1916 (as also the Cochin Act of 1921) stand superseded by the ISA of 1925, with retrospective effect for 1951.

One result of this judgment has been that daughters and sons can now share equally in their father's property, the judgment met with immediate protest from the Kerala Christian community on a number of grounds, some long-familiar: for instance, it was argued that inheritance by daughters would cause land fragmentation and would "open up a floodgate of litigation and destroy the traditional harmony and goodwill that exist in Christian families".³⁷ In addition, there was concern that allowing the Act to apply in retrospective effect would invalidate bona fide land and money transactions, nullify the land ceiling Act under which land had been distributed to the landless, and encourage thousands of Kerala nuns to claim their shares of ancestral property. Most of these fears appear to be unfounded; in any case, only intestate property will be affected. After Mary Roy, a few other Syrian Christian women have filed cases.³⁸ Meanwhile the protest against the Supreme Court ruling has been supported by the Synod of Christian Churches, which conducted a 'pulpit campaign' and arranged legal counsel to help draft wills to disinherit female heirs [Gandhi and Shah 1991:247].³⁹ Attempts to overturn the 1986 Supreme Court judgment, in particular that relating to its validity from

retrospective effect', continue [*Indian Express* 1994].

(2) THE PARSIS

Unlike most communities in India, the Parsis, governed by the twice-amended provisions of the Indian Succession Act (ISA) of 1925, have gender-equalitarian rules of succession today. Before 1991, the ISA, as amended specifically for Parsis in 1939, was applicable, under which the property of male and female intestates devolved according to separate rules [Paruck 1977]. In the deceased man's property (other than agricultural land), the widow and each son got double the share of each daughter. If the man left behind parents in addition to a widow and children, his father received a share equal to half that of his son, and his mother half that of his daughter. In agricultural land, the devolution was in accordance with the Parsi rules of succession applicable prior to the 1939 enactment. Here the widow and daughter respectively got one-half and one-fourth of what the son got, and the parents of the deceased got no land. In a deceased woman's property, the husband, son, and daughter got equal shares. Hence daughters shared equally with sons in the mother's property but unequally in the father's property. There were no restrictions on testation either by the man or the woman.

With the passing of the Indian Succession (Amendment) Act 1991 (Act No 51 of 1991) the difference in the succession of male and female property among Parsis has been removed. Now devolution of intestate property of a Parsi male or female is as follows. If the intestate leaves behind a widow/widower and children, these heirs get equal shares. Where there are no lineal descendants and no widow/widower of lineal descendants, the widow/widower of the deceased gets half the property. And if there are no lineal descendants, but there is a widow/widower of a lineal descendant, the latter gets one-third and the widow/widower of the deceased gets one-third, the remainder going to other relatives. All Indians (except in the context mentioned below) can opt out of their personal succession laws if they have a civil marriage under the Special Marriage Act of 1954, or have been married under the Special Marriage Act of 1872, or if their marriage is registered under the Special Marriage Act of 1954, even if it was contracted in another way. For such persons, the Indian Succession Act of 1925 applies,⁶⁰ under which (as noted) the widow of an intestate male with lineal descendants gets a fixed share of one-third in his property and his children of both sexes inherit equally in the rest.⁶¹ The exception is that after an enactment in 1976, two Hindus (or two Buddhists, Sikhs, or Jains) marrying under the Special Marriage Act of 1954 will be governed by the Hindu Succession Act of

1956, and not by the Indian Succession Act.⁶² In practice, very few persons opt for a civil marriage which would bring them under the purview of the ISA [GOI 1974:114].

IV

Laws Governing Muslims

(1) SCHOOLS OF LAW AND TEXTUAL RULES

The Shariat or Muslim religious law is derived from the Koran, the 'sunna' (practice of the Prophet), 'ijma' (consensus of opinion among the learned of the community) and 'qiyas' (analogical deduction) [Tyabji 1968:1]. There are two principal schools of Islamic law prevalent in India: the Hanafi school governing Sunni Muslims and the Ithna Ashari Shiite school governing Shia Muslims. Differences in the rules specified by these schools stem, in particular, from divergence in the acceptance or rejection of particular aspects of the sunna.⁶³

Today a vast majority of Muslims in India (constituting 11.4 percent of the population in 1981) as well as those in Pakistan and Bangladesh belong to the Sunni sect, and are governed by the Hanafi School, while a small percentage are Shiites governed mostly by the Ithna Ashari School. The inheritance rules under both systems are complex, and since they have been excellently spelt out in legal texts they will not be detailed here.⁶⁴ The broad aspects of the Hanafi School and some differences with Shia law are described below.

Broadly, under Hanafi law, heirs are divided into three major categories: agnatic heirs who are almost all male, Koranic heirs who are mostly female, and 'distant kindred' which includes the blood relations who are neither agnatic heirs nor Koranic heirs. The 'distant kindred' tend to be either women or connected to the deceased through a female link: e.g. daughter's children, son's daughter's children, daughters of male agnatic collaterals, children of female agnatic collaterals, paternal and maternal aunts and their children, maternal uncles and their children, and so on. These relatives are 'distant' not necessarily in terms of their blood relationship with the deceased, but in terms of likelihood of their ever coming into a share of the inheritance. The three categories of heirs – agnatic heirs, Koranic heirs, and distant kindred – together comprise the blood relations of the deceased and one relation by marriage (namely, the husband or the wife). In terms of shares allotted, the implicit rule is: "Keep the 'bulk' of the property for the [male] Agnatic Heirs... the persons whose rights were always recognised by tribal [pre-Islamic] law, and respect the Koranic provisions by giving *specific shares* to the persons mentioned in the Koran" [Fyzee 1974:399].

In specific terms, the shares of particular heirs under the Hanafi school are as follows: a daughter who is an only child receives a half share of the deceased parent's estate as a Koranic portion and is excluded by no other heir. If there are two or more daughters and no sons, they jointly get a two-thirds share which is divided equally among them. The presence of a son who is an agnatic heir, however, converts a daughter's right from that of a Koranic heir to an agnatic co-sharer, which means she gets half of what the son gets. Sons and daughters are excluded by no other heirs. Similarly a husband and wife, as Koranic heirs, are excluded by none: the husband receives a one-fourth share of his deceased wife's property if there is a child or a son's descendants, and a half share if there are no such heirs. A widow likewise receives either one-eighth or one-fourth of the husband's estate, depending on whether or not there is a child or son's descendants. If there is more than one widow, their collective share is one-eighth (or one-fourth, as the case may be), shared equally among them. Full sisters and consanguine sisters also share as Koranic heirs but can get excluded by male agnatic descendants and ascendants, as can uterine sisters under specific circumstances.⁶⁵ The mother gets a basic Koranic share of one-sixth, as does the father.

The Shia law of succession is noted to differ from the Sunni law, especially in the following respect:⁶⁶ no relative of the deceased male is excluded merely on grounds on his/her sex or because s/he is related to the deceased through a female link. Cognates and agnates are placed on an equal footing. Hence males and females who are linked to the deceased in equal blood or degree inherit together, although female shares continue to be half those of males. For instance, if the deceased leaves a son's son's son and a daughter's daughter, under the Hanafi school the former as a male agnatic heir excludes the latter. Under the Shia system the daughter's daughter has precedence, being deemed a higher 'class' of descendant (that is, closer by blood to the deceased). Tyabji (1968:897) clarifies the underlying differences between the two systems as follows:

[T]he Hanafis take the Quranic alterations of the Pre-Islamic customs literally, and the Shiites take them as illustrations of underlying principles. The former let the substratum of the customary law stand unaltered except to the extent to which it is definitely altered by the express provisions of the Quran. The Shiites take each instance mentioned in the Quran as speaking not only for itself but as indicating the possible principles.

The Shia system thus has more positive implications for women's inheritance.

In general, though, all schools of Islamic law recognise Muslim women's inheritance rights in immovable property, although unequal to those of men. These rights also have some degree of protection from testation. Among the Hanafi Sunnis, for instance, an estate (in full or in part) cannot be willed to a heir without the consent of all the heirs, but a maximum of a third of the estate can be willed to a stranger without the consent of the heirs. Under Shia law, bequest to heirs or non-heirs of up to a third of the property is permitted without the consent of other heirs.

(2) CUSTOM AND THE SHARIAT

In practice, there has been considerable historical divergence between the scriptural texts and local customs in Muslim women's inheritance rights, a divergence which has a critical bearing on their rights in agricultural land even today. Customs deviated from the textual rules especially in two ways. In parts of southwest India, a few Muslim communities (principally the Mappilas of Kerala and the Lakshadweep Islands) practised matrilineal inheritance (that is property, including land, passed through the female line). In the rest of the subcontinent, many Muslims appear to have followed customary practices of inheritance similar to those prevalent among the patrilineal Hindus in their region of residence,⁶⁷ among whom, as noted, women's customary rights were highly restricted. This meant considerable divergence from the Shariat, especially in large parts of northwest India, where under prevailing customs typically (a) a daughter was either totally excluded from the inheritance of any landed property, or came very low in the order of heirs; a widow likewise came low in the order of heirs, and (b) both widow and daughter if they inherited took only a limited interest, rather than an absolute interest as would have been their due under Islamic law. There were of course Muslim communities among whom affluent families sometimes gave daughters a share of the patrimony under the Shariat, or occasionally (especially if sonless) created an endowment ('waqf') for them, both of which resulted in some Muslim women from such families controlling property, including land [Kozlowski 1989]. But there is little to suggest that this was a widespread practice, even among the affluent.

Attempts at legal reform during this century have essentially been in the direction of overruling custom in favour of the Shariat. In the 1920s and 1930s Muslim reformers increasingly sought to establish the Shariat as the basis of Muslim personal law. Although political considerations largely underlay such attempts at reform, in which women's legal status was in large part only of symbolic importance, this had the potential for a

positive fall-out for women, given the recognition accorded to female inheritance rights in the Shariat.⁶⁸ There was a major move in this direction when a Muslim member of the Punjab legislature had a bill introduced in the Federal Legislative Assembly of India calling for the supersession of custom by the Shariat as the basis of personal law for all Muslims in undivided India [Parashar 1992].⁶⁹ The bill, which was taken up for consideration in 1937, generated substantial controversy.⁷⁰ In particular, there was strong opposition from the landowning classes of the Punjab on the ground that the bill would ruin agriculturists.

However, unlike the Hindu Code Bill, whose clauses went directly against orthodox Hindu opinion, a bill to enforce the Shariat – the holy law of Islam – could not be opposed openly by the orthodoxy. Indeed such a bill could be used as a symbolic means of politically affirming Muslim identity and solidarity. A number of scholars suggest that it was such considerations, rather than gender equality, which principally motivated the Muslim League to get the Muslim Personal Law (Shariat) Application Act, 1937, passed.⁷¹ Under the Act, prevailing customs or usage were abrogated in favour of Muslim personal law (the Shariat), *but the Act explicitly excluded agricultural land from its purview*, the devolution of which would continue to be governed by local customs. The Act was valid for all Muslims of undivided India, except those in Jammu and Kashmir. While ostensibly meant to extend women's property rights, effectively the Act hardly served that purpose, since agricultural land, which constituted the most significant form of property held by the community, was excluded. The Act, therefore, served the political purpose of affirming Muslim identity, without antagonising the powerful Punjabi landlords.

The passage of the 1937 Shariat Act differed from that of the Hindu Code Bill (HCB) in at least two important respects: one, the shift here was toward and not away from the scriptures, and therefore the Act encountered less widespread opposition than did the HCB. Two, although the reform was supported by urban-educated Muslim women and some Muslim women's groups,⁷² at that time they do not appear to have played the kind of active mobilising and lobbying role that was played by the AWC and other predominantly Hindu women's organisations for the codification of Hindu law.⁷³ The situation changed somewhat after Pakistan was formed, with Pakistani women's organisations playing a more active role in campaigning for women's rights, including the reform of Muslim personal law.

Legal reform affecting Muslim women in the subcontinent took different regional directions after India's independence in 1947, and the country's partition and formation of

Pakistan. An early step taken by the Pakistani state was the passing of the West Punjab Muslim Personal Law (Shariat) Application Act of 1948, which included agricultural land in its purview. This Act (like the 1937 Act) encountered considerable resistance from the landlord-dominated West Punjab Provincial Assembly, whose delaying tactics caused several hundred urban-educated women to demonstrate outside the assembly chambers [Jalal 1991]. Two years later, in 1950, the province of Sind also amended the 1937 Shariat Act to include agricultural land. But it took another twelve years before the West Pakistan Muslim Personal Law (Shariat) Application Act of 1962 extended the Shariat as the basis of personal law to the whole of West Pakistan, except the 'Tribal Areas' in the NWFP.⁷⁴ This Act abrogated custom as the basis of law and legally entitled Muslim women to inherit agricultural property as full owners (and not just as a life interest), as prescribed by the Shariat. Women leaders and women's organisations, especially the All Pakistan Women's Association, played a significant role in pushing for these changes by agitating for reform in family law and against the gender inequalities of customary laws.⁷⁵ For Muslim women in Pakistan the 1962 Shariat Act removed one of the main gender disabilities embodied in the 1937 Shariat Act. (The basic gender inequalities embedded in Islamic inheritance laws (e.g. a daughter's share being half that of a son) could not, of course, be touched as long as the Shariat was the basis of law.)

These changes did not affect the Muslims of East Pakistan (now Bangladesh), who continued to be governed by the 1937 Shariat Act. But here women have not been legally disadvantaged by the absence of subsequent amendments, since even prior to this enactment customs at variance with Islamic law were not required to be enforced in (undivided) Bengal: here the Shariat therefore applied also to agricultural land.⁷⁶

In India too, the 1937 Shariat Act has continued to be applicable even after independence. Although this is not a disability for Muslim women in some states, it is in others (Table 4). For instance, in 1949, the Act was amended to include agricultural land in Tamil Nadu, parts of Karnataka which fell in former Madras Province, and the Andhra area of Andhra Pradesh.⁷⁷ Kerala followed suit in 1963.⁷⁸ In Maharashtra and Gujarat, as in the case of Bengal (noted above), there was no strong presumption in favour of custom even before the Act was passed; hence here the Shariat rules could be applied to agricultural land as well.⁷⁹ The same is true of the parts of Andhra Pradesh and Karnataka which were earlier part of the former Hyderabad state, and where custom at variance with Mohammedan law was not admitted even

prior to the 1937 Shariat Act [Mulla 1990:11]. But in the states of northwest India, the Act has not been amended to include agricultural land, and in most of these states, such as Delhi, Haryana, Himachal Pradesh, Punjab, and Uttar Pradesh, strong customs governing the devolution of agricultural land prevailed prior to the Act; and these still govern the succession of such land. Under these customs, male lineal descendants in the male line of descent are typically the first order heirs in the inheritance of agricultural land. In these states, therefore, severe gender inequalities (over and above those already embedded in the Shariat) continue to characterise succession among Muslims in relation to the most important form of property in the countryside. And unlike among Hindus, these inequalities relate to all agricultural land and not only to land under tenancy.

While the primacy given to custom in northwest India has worked to the detriment of Muslim women there, so that a shift to the Shariat would be a positive step, such a shift has had the contrary effect for Indian Muslim women belonging to matrilineal communities, namely, the Mappilas of north Kerala and the Lakshadweep Islands. The shift has been gradual. British enactments in the early part of the 20th century only brought some categories of Mappila property under Islamic law, leaving other categories untouched. For instance, in relation to undivided joint family estates, the Mappilas continued to be governed by the *Marumakkathayam* laws (similar to those governing the Nayers and other matrilineal communities of southwest India), which gave women primary inheritance rights in ancestral property, including land. But for property that was individual in nature, they were subject to the Shariat. Subsequent enactments in the 1960s, however, extended the jurisdiction of the Shariat to all property held by the Mappilas. The Mappila Marumakkathayam (Amendment) Act, Kerala Act 32 of 1963, substituted the word 'Muslim' for Mappila [Derrett 1968: 528, 525-30]. Under this Act, the share of any member of the Mappila joint property holding unit would devolve according to the Shariat rather than the matrilineal law. These amendments subordinated Mappila women's rights, even in ancestral property, to those of men.

V

Summary Comments on Women's Legal Rights in Agricultural Land.

Prior to the 1950s, women of most communities in India had few and restricted legal rights in landed property. Noteworthy exceptions were communities (tribal and non-tribal) practising matrilineal or bilateral inheritance. Today, women have signi-

ficantly greater property rights, but some critical gender inequalities persist, their extent varying by region and community.

In relation to succession these inequalities are of three kinds. First, among several religious groups women are entitled to smaller shares than men. For instance, under Islamic law, and under the laws governing some categories of Christians, daughters inherit only a portion of what the sons do. Also under Hindu law in India, the vestiges of the *Mitakshara* system in many states give sons but not daughters rights in certain categories of property. Second, tribal communities of the northeastern states continue to be governed by uncodified customary law under which, among patrilineal tribes, women's rights in land are severely circumscribed and typically limited to usufruct. Third, and most importantly, there are specific gender biases pertaining to the devolution of agricultural land. For example, for Hindus in several states of northwest India, the rules of devolution specified in various tenancy and other land reform enactments give priority to male agnatic heirs, and supersede the rules of devolution spelt out in the Hindu Succession Act of 1956. Similarly for Muslims, again in most northwestern states, customary practices (and land reform laws) which are more gender-unequal than Islamic law supersede the latter in relation to the inheritance of agricultural land.

Apart from the inheritance rules, land reform enactments contain other gender inequalities. For instance, in laws pertaining to the fixation of ceilings, many states allow additional land to a cultivator on account of adult sons, or allow adult sons to directly hold such additional land in their own right, but adult daughters are given no such consideration; and in several states, unmarried adult daughters do not figure either as part of the family unit, or as independent units. Again it is the states of northwest India which are the worst (although not the only) offenders on this count. Also in the assessment (and state appropriation) of ceiling surplus land, the land of both spouses is typically aggregated, leaving the wife vulnerable in practice to disproportionately losing her land, especially in the northern states. These ceiling laws affect all religious communities.

To bring about gender equality in laws pertaining to property, and especially those pertaining to agricultural land, these inequalities and anomalies will clearly need to be addressed. Their continuation violates both the letter and the principle of gender equality that is promised as a fundamental right under the Indian Constitution. In addition, certain aspects of the laws which are not technically gender-discriminatory but become so in practice, need amendment. For instance, the power of unrestricted

testation under Hindu Law could, in theory, affect sons and daughters equally, but given the social bias in favour of endowing males it works to women's disadvantage. There is thus a case here for limiting testamentary power to protect female heirs. Doing so would not be without precedent: a number of legal systems in Europe, for instance, also restrain testamentary freedom [Sivaramayya 1973:64], as does Islamic law. Again, there is no concept of community of property after marriage under Hindu law. Hence, on divorce, a woman gets no property benefit from any direct or indirect economic contribution she makes during her marriage toward increasing her husband's wealth. There is a case here for establishing equal rights for both spouses in the ownership and control of property acquired by either spouse after marriage, and for an equal division of such property on divorce.

Removing the noted legal inequalities is likely to involve a continuing process of contestation and struggle. In this context, on the one hand there have been some significant cases, such as those filed by Mary Roy and Madhu Kishwar. By drawing upon constitutional guarantees of sex equality to challenge persisting gender inequalities in enactments concerning inheritance, these cases have opened up yet another chapter in the contestation over women's legal rights in land that began almost a century ago. [This is important even though (as noted) the judgment in Mary Roy's case evaded the issue, and a judgment in the case filed by Madhu Kishwar is still pending.] On the other hand, the placing of most land reform laws beyond challenge on constitutional grounds, through their inclusion in the Ninth Schedule, has taken away a major means of changing the gender-unequal land-related legislation still prevailing in many states.

If women today are to play a significant role as law makers and not just as law takers, their struggle will need to be increasingly conducted not only from outside the state apparatus, but also from within it. Greater representation by gender-progressive women in the legislatures, the judiciary, and the many tiers of the legal machinery, would be a necessary part of that process, as would be the creation of a favourable ideological climate, the absence of which can lead to retrogressive shifts, as illustrated especially by women's experience under regimes dominated by religious fundamentalist forces in the subcontinent.

Moreover, legal restrictions are only one part of the story. The other part [detailed in Agarwal 1994] relates to the many formidable obstacles that constrain women from exercising even the legal rights they currently have. From that perspective, although legal transformation is a critical step forward, it is only one of many steps that must be taken for women's empowerment.

Notes

[This paper draws upon and extends the discussion presented in my book: *A Field of One's Own: Gender and Land Rights in South Asia* (1994). I owe an immense debt to B Sivaramayya, Professor of Law (retd), Delhi University, for the time and care he has taken in commenting on several drafts of this paper, clarifying obscure legal points, and directing my attention to material which I would otherwise have missed. However, he bears no responsibility for any errors or omissions that may remain. To Lotika Sarkar I am grateful for earlier discussions on some aspects. And I thank the staff of the Supreme Court judges' library (legislation section) for their considerable assistance in locating state-level local acts.]

- 1 Parliamentary Debates, September 20, 1951 [see GOI 1951b:2930].
- 2 Parliamentary Debates, February 7, 1951 [see GOI 1951a:2530].
- 3 The only ground on which the Ninth Schedule can be challenged is if it violates the "basic structure of the Constitution" [GOI 1990:39]. However, there have as yet been no clear pronouncement (other than on the concept of secularism) on what constitutes the Constitution's basic structure.
- 4 The *Dayabhaga* system, based on a digest composed by Jimitavahana (a Bengali brahmin), held sway mainly in Bengal and Assam, and the *Mitakshara* system, based on a commentary on the *Yagnavalkya smṛiti* by Vijnaneshvara (from south India), held sway in the rest of the country. Between the 13th and 16th centuries, the *Mitakshara* school branched into four sub-schools which came to be known as the Mithila, Bombay, Madras, and Benaras schools. These sub-schools differed in particulars while being bounded by the general principles of the parent doctrines. For discussions on women's inheritance rights in property as enunciated in *shastric* texts prior to the *Mitakshara* and *Dayabhaga* texts, see especially Kane (1946), Vishnoi (1987), and Altekar (1956). As the discussions by these authors indicate, although there were some notable differences in the approaches of different *smṛiti* writers and subsequent commentators, the inheritance rights granted to women in the earlier texts were not more than (and typically were less than) those recognised under *Mitakshara* and *Dayabhaga*. The *Yagnavalkya smṛiti* on which the *Mitakshara* was based, was among the more liberal of the *smṛitis*.
- 5 For these features I draw primarily on Kane (1946), supplemented by Mayne (1900, 1953), Altekar (1956), Carroll (1991), and Mulla (1982).
- 6 The joint family here is a legal concept and need not coincide with joint residence or any other aspect of a common household economy that may be implied in a sociological use of the term.
- 7 Agnates are individuals of either sex who have descended through the male line and trace descent from a common male ancestor. In other words, they are so related to the deceased that there is no intervening female link. For instance, a daughter is an agnate

but a daughter's child is not, while a son's son and son's daughter are both agnates. A cognate, in the legal literature, is defined as a person related to the deceased "through one or more female links" [Fyzee 1974:403, in the context of Islamic law] or "not wholly through males" as in The Hindu Succession Act [Mulla 1982:913]. Hence a daughter's son or daughter's daughter are cognates. In other words, in the legal literature, agnates and cognates are treated as mutually exclusive. In the anthropological literature, however, the category cognates includes agnates [see, e.g. Fox 1967:49; and Fortes 1969:267]. In the context of this discussion, the legal definition is applicable.

- 8 The term 'limited estate' (or 'limited interest') is legally used only in relation to Hindu women. An analogous term, derived from English law, is 'life estate' (or 'life interest'). Both terms (viz. limited estate and life estate) mean that the woman can enjoy the property only for life, but there are differences in the restrictions on transfers. A Hindu woman's limited estate did not allow her to alienate the property, except in the specific restricted contexts mentioned above. A life estate meant that the woman could freely transfer the property, viz. lease out, mortgage or sell it, although such transactions were only valid for the duration of her life [Personal communication, B Sivaramayya 1992].
- 9 Those to whom the property ultimately reverted if the present heir died or relinquished her/his rights to it.
- 10 See discussions in Kane (1946), Mayne (1953), and Altekar (1956).
- 11 The daughter's son, unlike the daughter, received the property as an absolute estate. In the absence of the daughter's son, the property went to the deceased man's parents and then to his brothers and their sons.
- 12 See, e.g. Banerjee (1984:355), first published in the 1890s. Also see Mayne (1953), Kane (1946), and Roy (1911).
- 13 Hence the "daughter appointed as a son" appears not to have meant that she inherited the estate like a son, but that her son was equivalent to what a son's son would have been.
- 14 See especially Kane (1946) and Mayne (1953).
- 15 Later, under the British, testamentary disposition was also expressly recognised.
- 16 The undivided estate being referred to here is an estate that may be held jointly, say by a man and his brothers. Under *Dayabhaga*, the father and sons were not coparceners in a joint estate (as they were under *Mitakshara*), but sons who inherited on the father's death could hold their inherited property jointly as coparceners, each holding a clearly defined share. Each such coparcener had full rights of disposal over his share, and his interest in which, while still undivided, could pass on his death to his own heirs, male or female.
- 17 For details see especially Kane (1946), Banerjee (1984), Mayne (1953), Altekar (1956) and Tambiah (1973), all of whom examine the diversity of views on these aspects and the shifts in these views over time.
- 18 For more details on the roles played by women's organisations and progressive male reformers in pushing forward legal reform for the benefit of women during this period, see Agarwal (1994).
- 19 Of these the AIWC was the most prominent during this period. By the mid-1930s, the AIWC and WIA jointly had over 10,000 members [Forbes 1981:54].
- 20 Apart from national women's organisations, such as the AIWC and the NCWI, local ones also emerged during this period, often despite considerable male opposition. For instance, in the first two decades of the twentieth century, as demand for social reform grew in Kerala (discussed in relation to the Nayar in Agarwal, 1994), some Nambudiri Brahmin women formed organisations demanding the right of every woman within the community to marry, to inherit a share of the property, and to education [Arunima 1992].
- 21 For details of the Act see Kane (1946).
- 22 A few states subsequently (some prior to, others soon after independence) passed laws extending the Hindu Women's Right to Property Act 1937 to include agricultural land. These included Bihar, Hyderabad, Orissa, the United Provinces, and Bombay. However, the efficacy of this extension was weakened by a clause that such legislation would not affect any rule of succession prescribed for tenants' rights in agricultural land by any special law then in force.
- 23 See statements by Pandit Lakshmi Kanta Maitra in the Constituent Assembly of India (Legislative) Debates on the Hindu Code, March 1, 1949 [GOI, 1949:996-7].
- 24 These were The Hindu Marriage Act 1955, The Hindu Succession Act 1956, The Hindu Minority and Guardianship Act 1956, and The Hindu Adoptions and Maintenance Act 1956.
- 25 The Constitution's guarantee of no discrimination on the basis of sex has, in fact, been used to challenge continued gender-related inequalities in property laws: cases in point are those filed by Mary Roy and by Madhu Kishwar, discussed later.
- 26 In this state, the Jammu and Kashmir Hindu Succession Act, 1956 (Act No 38 of 1956) applies, which (with some modifications) contains most of the provisions of the Hindu Succession Act of 1956.
- 27 For details of the Act see especially Mulla (1982).
- 28 See GOI (1983). The Planning Commission Working Group, set up to examine the legal systems of the northeast, recommended even in 1983 that on family, inheritance, and land laws "there should be as little interference... as possible" [GOI, 1983:23]. Although this is an advantage for women among the matrilineal communities of Meghalaya and Assam, among patrilineal tribes of the region the customary laws tend to be gender-inegalitarian.
- 29 Class I heirs are those who have the first right to the property of the deceased. In the absence of Class I heirs, other 'classes' of heirs follow.
- 30 In Punjab, the customary law has been upheld, under which a male cannot will away his share of ancestral agricultural land.

- [*Kaur Singh Gajjan Singh v Jaggar Singh Kehar Singh*, AIR, 1961, Punjab 489]. Also see the decision on *Joginder Singh v Kehar Singh*, AIR (1965), Punjab 407.
- 31 For Andhra Pradesh, see Sivaramayya (1988); and for Tamil Nadu see The Hindu Succession (Tamil Nadu Amendment) Act 1989 (Act No 1 of 1989). For Maharashtra, see the Legislative Assembly Bill No 29 of 1994 (which, since its enactment, has received the assent of the president of India).
 - 32 Even in Andhra Pradesh, Tamil Nadu, and Maharashtra, some points listed below are still applicable. For instance, rights of female Class I heirs other than daughters, such as the widow, can be prejudicially affected if the male coparcener renounces his rights in the coparcenary property or converts his separate or self-acquired property to coparcenary property (as will become clear from the discussion that follows).
 - 33 In UP, although the deceased man's widow comes only after all male lineal descendants in the male line, the sonless widow of a male lineal descendant counts among the first order heirs and inherits her deceased husband's share provided she has not remarried.
 - 34 Section 40 of The Andhra Pradesh (Telangana Area) Tenancy and Agricultural Lands Act, 1950 (Act 21 of 1950) says that the tenancy of the protected tenant (that is the person holding lands as a tenant at the commencement of the Act) will devolve on "(a) his legitimate lineal descendants by blood or adoption; (b) in the absence of any such descendants, his widow for so long as she does not remarry." The commentary in this section clarifies that in case of a conflict with the Hindu Succession Act of 1956, the succession of the separate property of the Hindu tenant will be according to the HSA (see *The Andhra Pradesh Local Acts: 1802-1981*, Vol 16, Asia Law House, Hyderabad, pp 101-2).
 - 35 See the cases cited in the commentary to Section 40 in the Rajasthan Tenancy Act 1955 (Act No 3 of 1955); *Rajasthan Local Acts (1949-70)*, Vol 16, India Publishing House, Jodhpur, 1976.
 - 36 For other regions of Maharashtra also, there is no clear specification of the order of devolution (see note 3 in Table 2).
 - 37 For Bihar, see the Bihar Tenancy Act 1885 (Act No 8 of 1885) and the Chota Nagpur Tenancy Act 1908 (Bengal Act No 6 of 1908); and for Orissa, see the Orissa Tenancy Act 1913 (B and O Act No 2 of 1913).
 - 38 In the above mentioned case, the petitioners (Madhu Kishwar, and women of the Ho and Oraon tribes), challenged, under Article 32 of the Constitution, the provisions of the Chota Nagpur Tenancy Act of 1908, which confines succession to the property of certain types of occupancy tenants to males in the male line of descent. The petitioners contended that the provision is discriminatory against women. On its part, the state of Bihar pleaded that scheduled tribe women in the state could not inherit since "by custom prevalent among the scheduled tribes a female heir is excluded from succession and in case the law was otherwise interpreted or changed and property was allowed to go into the hands of female heirs, there would be great agitation and unrest in the area among the scheduled tribe people who have custom-based living."
 - However, the judge in the case brought in the concept of Hindu law and stated that "[women's] exclusion from inheritance would not be appropriate", and asked the state of Bihar to re-examine "the feasibility of permitting inheritance and simultaneously regulating such inheritance for the purpose of ensuring that the property does not go out of the family by way of transfer or otherwise". If this is done, it would mean the overruling of custom to uphold a woman's right of inheritance, although it would fall short of upholding her full rights of transfer over the property, as she would have had under the Hindu Succession Act. However, since this 1992 court order, the matter is still pending and judgment has yet to be pronounced, even though the case was to be disposed of in three months, as per the court's ruling in 1992. [It may also be noted that the Chota Nagpur Tenancy Act of 1908 is not included in the Ninth Schedule of the Constitution.]
 - 39 This includes: The Andhra Pradesh Land Reforms (Ceiling on Agricultural Holdings) Act 1973 (Act No 1 of 1973); The Bihar Land Reforms (Fixation of Ceiling Area and Acquisition of Surplus Land) Act 1961 (Bihar Act No 12 of 1962); The Bihar Land Reforms Act 1950 (Bihar Act No 30 of 1950); The Karnataka Land Reforms Act 1961 (Act No 10 of 1962); The Madhya Pradesh Ceiling on Agricultural Holdings Act 1960 (No 20 of 1960); The Maharashtra Agricultural Lands (Ceiling on Holdings) Act 1961 (Act No 27 of 1961); The Orissa Land Reforms Act 1960 (Orissa Act No 16 of 1960); The Punjab Land Reforms Act 1972 (Punjab Act No 10 of 1973); The Saurashtra Land Reforms Act 1951; The Tamil Nadu Land Reforms (Fixation of Ceiling on Land) Act 1961 (Act No 58 of 1961); The Uttar Pradesh (Imposition of Ceiling on Land Holdings) Act 1960 (Uttar Pradesh Act No 1 of 1961); The West Bengal Land Reforms Act 1955 (West Bengal Act No 10 of 1956). The Madhya Pradesh Land Revenue Code 1959, however, appears to be an exception: as noted, it explicitly mentions the order of devolution which, after the 1961 amendment, is according to personal law for both owned land and land under tenancy (also see note 3 in Table 2).
 - 40 Neither the Uttar Pradesh Zamindari Abolition and Land Reforms Act 1950 (termed below as UP (ZALR) Act) nor earlier acts such as the Uttar Pradesh Revenue Act 1901 and the Uttar Pradesh Tenancy Act 1939 give a clear definition of *bhumidhar*. What is indicated, however, is that the *bhumidhar* is a tenure holder or full proprietor with permanent heritable and (in most cases) transferable rights to the land, and who is liable to payment of land revenue to the government. This last point is clearly stated (see S 242 of the UP (ZALR) Act) and this is what is of most relevance to the present discussion. Sirdar is a landlord or under-proprietor or a permanent tenure holder who possesses air and who has hereditary rights to the land. Sir is a name given to village lands cultivated by hereditary proprietors or village zamindars themselves. An *asami* is a tenant, and includes non-occupancy tenants of land with no stable rights (UP (ZALR) Act). For further details and definitions see the original Acts; also see Srivastava (1976), Sivaramayya (1973) and GOI (1976).
 - 41 I am using the term 'cultivator' here in a general sense. The actual term used differs by state: for instance, in Uttar Pradesh the term used is 'tenure holder'.
 - 42 In Haryana, the allotment for the adult son is made to the parents if the son is living with the parents, but he counts as a separate unit if living separately.
 - 43 A point to note, though, is that in Haryana, Himachal Pradesh and Punjab, the devolution rules specified in the land reform enactment exclude the daughter essentially in land under tenancy, while in UP and Delhi, as noted, they exclude them effectively in all agricultural land, because of the very broad definition adopted by these two states on who constitutes a 'tenant'.
 - 44 For details of the recommendations made by the two committees mentioned and the guidelines specified subsequently, see GOI (1976:37-39).
 - 45 Article 14 of the Constitution of India promises equality before the law, and Article 15 prohibits discrimination on the basis of sex, etc. Both constitute part of fundamental rights [GOI 1990].
 - 46 For citations of some cases challenging the Ceiling Acts see: The Haryana Ceiling on Land Holdings Act 1972; The Punjab Land Reforms Act 1972; The Andhra Pradesh Land Reforms (Ceiling on Agricultural Holdings) Act 1972; and GOI (1976).
 - 47 See 'Ambika Prasad Mishra v the State of UP and Others' in Supreme Court Cases (SCC) (1980): 719).
 - 48 The literature on this issue is vast, but see especially Frankel (1978), Joshi (1974), and Dasgupta (1977).
 - 49 For instance, the Andhra Pradesh Land Reforms (Ceiling on Agricultural Holdings Act) 1973, specifies that the extent of land surrendered by a female family member cannot exceed the proportion of her land to the total land held by all members of the family unit. Similarly, the Karnataka Land Reforms Act 1961 (Act No 10 of 1962), specifies that "the extent of stridhan land to be surrendered shall in no case be more than the proportion which [such] land bears to the extent of other land held by the family". And the Tamil Nadu Land Reforms (Fixation of Ceiling on Land) Act 1961 (Act No 58 of 1961) gives stridhan land special consideration, and allows female family members to hold additional land, over and above the ceiling specified for a family unit (subject to a maximum).
 - In these acts, stridhan land is basically defined as land held by any female family member in her own name.
 - 50 See 'Kunjilata Purohit v Tahsildar, Sambalpur and Others', AIR (1986a), Orissa 115.
 - 51 Personal communication from Sivaramayya, 1992.

52. The otherwise insightful 'Moras Report' [Moras and Berger 1992], in its review of the project, also failed to take this into account.
53. See 'Prem Singh v Lilavati' (AIR 1956), Himachal Pradesh 17. Also see Sivaramayya (1978).
54. In 1926 Section 33-A was added to the Act giving a widow additional rights if the deceased man, dying intestate, left no lineal descendants. However, this section does not apply to Indian Christians and several other categories of persons otherwise governed by the ISA.
55. See 'Kurian Augusty v Devassy Alely' in AIR (1957), Travancore-Cochin 1; also see, Sivaramayya (1978).
56. For details of this case see 'Mrs Mary Roy v the State of Kerala and Others' in AIR (1986b), SCC 1011.
57. P J Kurien, cited in Gandhi and Shah (1991:247).
58. For instance, Alely Chacko, an 84-year-old Syrian Christian woman was turned out of her ancestral home by her son, who seized the 70 cents of land she had been given as dowry by her parents. Like Mary Roy, Alely Chacko and her five daughters have petitioned the Supreme Court of India [Manushi 1987].
59. In some cases, wills have also been forged retrospectively. Arundhati Roy, Mary Roy's daughter, recounted the following example to me. Alelykutty Thommen filed a case for her share in her family's property after her brother refused to part with it. He forged a will which was rejected by the court. In 1991 she fenced off a part of her brother's rubber estate, built a shelter there, and claimed she was tapping the rubber, which (I was told) protects her from eviction under the occupancy laws of the state. She is now said to be making a significant profit from the land.
60. A Hindu male marrying under the Special Marriage Act is automatically severed from the joint family estate.
61. As noted, Section 33-A of the Act, inserted in 1926, gives some additional advantages to widows, but it does not apply to several categories of persons, including Indian Christians as well as Hindus, Buddhists and Jains, whose property would be governed by the ISA.
62. See Marriage Laws (Amendment) Act 1976 (Act No 68 of 1976).
63. See the discussion in Fyze (1974) and Sivaramayya (1973).
64. See, e.g., Fyze (1974), Mulla (1990), and Tyabji (1968). For a clear exposition, accessible to a general reader, also see Carroll (1983, 1985).
65. Full sisters are daughters from the same set of parents. Consanguine relationships result when a man has children from two or more wives; uterine relationships result when a woman has children from two or more husbands [Carroll 1983: 632].
66. See Tyabji (1968) and Carroll (1985).
67. For instance, the Khojas of northwest India, the Cutchi Memons, the Sunni Bohras of Gujarat, the Moleslam Girasias of Broach, the Halai Memons of Porbander (Gujarat), and most Muslim communities in the Punjab, are said to have followed local customs of inheritance similar to those followed by the Hindus, which were at considerable variance with the Shariat [see Agarwal 1994, for details].
68. Only a few Punjabi reformers were explicitly concerned with women's rights: Gilmartin (1981:168) mentions two by name, including a woman - Bai Rashida Latif.
69. Just prior to this, the North West Frontier Province (NWFP) had enacted the North West Frontier Province Muslim Personal Law (Shariat) Application Act, 1935, establishing the Shariat as the basis of inheritance rules (among other things) and superseding customs prevailing in the province.
70. For a flavour of the debate in the assembly, see Jafar et al (eds), (1977:chapter 6).
71. See, e.g., Gilmartin (1981), Jalal (1991) and Lateef (1990).
72. For instance, the *Anjuman-e-Khawatin-e-Islam* (the All-India Muslim Ladies' Conference) included women's rights to property as one of its demands and its Punjab wing supported the Shariat Bill in 1937 [Jalal 1991; Minault 1981]. The issue of women's (including Muslim women's) property rights had also come up indirectly in the 1920s during women's struggle for enfranchisement. As both Hindu and Muslim women pointed out, linking the franchise with property and income qualifications made for a significant gender gap in electoral representation, since few women owned property in their own names [Everett 1979].
73. The concerns of Muslim women's groups during the early part of this century centred primarily on women's education [Minault 1981; Mumtaz and Shaheed 1987; Lateef 1990].
74. The NWFP of Pakistan is administratively divided into 'Tribal Areas' and 'Settled Areas' [Ahmed 1980:9-10]. In the Tribal Areas: (a) no criminal or civil procedure codes of Pakistan apply; (b) they are not subject to taxes or rents of any kind; (c) they are federally administered but are attached to the Provincial Government of the NWFP for administrative purposes because of geographic and historical reasons; and (d) no political parties are allowed, and the voting right is reserved for selected groups.
75. See, e.g., Patel (1979), Mumtaz and Shaheed (1987), and Rashid (1987).
76. In Bengal, Agra and Assam, the 1887 Bengal, Agra and Assam Civil Courts Act, XII of 1887, along with the Bengal and Assam Laws Act, 1905, established that Islamic law would prevail on all questions relating to succession, inheritance, marriage, and any religious usage or institutions, except insofar as such law had been altered or abolished through legislative enactment [Mulla 1990:7]. Also see Tyabji (1968:18) and Patel (1979:5). Personal communications from several Bangladeshi legal experts on laws affecting women, including Salma Sobhan and Rabia Euyian, confirm this reading.
77. See The Muslim Personal Law (Shariat) Application (Madras Amendment) Act 1949 (Madras Act 18 of 1949) which applies to both Tamil Nadu and parts of Karnataka under former Madras Province; and the Muslim Personal Law (Shariat) Application (Andhra Pradesh) (Andhra Area) Amendment Act, 1949 (Act 18 of 1949).
78. See the Muslim Personal Law (Shariat) Application (Kerala Amendment) Act 1963 (Act 42 of 1963).
79. See Tyabji (1968:18) for Bengal, and Mulla (1990:8-9) for Maharashtra and Gujarat (earlier in Bombay state).

ECOLOGY: Basic and Applied

By
S C Santra

The book presents the significant concepts of modern ecology in a readable and intelligible way. The author has tried to present scientific development on various ecological problems for readers of different categories. Topics dealt with in the book cover modern approaches and techniques, and the broader aspects of ecology.

1994, 250p, ill, maps, bibliography, index; 22x14 cm

Feminification of Theory

Dipankar Gupta

The feminification of theory draws attention to the fact that the postmodern insistence on reading everything as text finds its fullest efflorescence in the domain of feminist studies. Regardless of gender, the postmodern credo encourages a partisanship towards contemporary feminist scholarship and a concomitant downgrading of both theory and conceptual and disciplinary rigour.

I

THE postmodernist denigration of theory and of disciplinary grids as 'fictions', of one kind or another, has significantly influenced a wide range of scholarship. But it is in contemporary feminist studies, more than anywhere else, that this intellectual attitude has been fully realised. True to the postmodernist credo, feminism today advocates 'writing the body' (*l'écriture féminine*) where depth, metaphor, metonymic play, open ended interpretive discourse, poetics, and subjectivity displace notions of theory and disciplinary boundaries. Without wishing to exaggerate, it may well be said that feminist scholarship today serve as exemplars of the postmodern intellectual condition.

The impact of postmodernism is somewhat akin to what the New Left attempted in the 1960s, for then too a premium was placed on how vociferously one could blame one's discipline for past errors. But this similarity is a little superficial as the New Left were deeply committed to Marxism as a foundational paradigm, even if they did not quite respect the disciplinary pretenses of history, economics, sociology and so forth. This, however, was only a New Left tendency and certainly did not embrace in its sweep those who remained, for whatever reason, members of the 'old' left. In India, old leftists included Sukhamoy Chakravarty, KN Raj, Boudhayan Chattopadhyaya, D D Kosambi, Susobhan Sarkar, and a host of others, against whom it would be unfair to allege that their commitment to Marxism blinded them to disciplinary specifics [see Beteille 1994]. If anything, all of them found in Marxism the necessary inspiration to advance the frontiers of their respective disciplines.

It is relevant to make this argument for only then can the impact of postmodernism on contemporary scholarship be fully understood. While both Marxism and postmodernism attained cultish status at different points of time, the groupies and eager acolytes that gathered around these divergent *isms* were not fired by the same intellectual motivation. While Marxists of all hues search for essential underlying principles, the postmodernists believe in the

dispersal and deferral of meaning, advocating a play on words to bring out possible sub texts, and so forth. This implies that any intellectual quest for certitude was tantamount to a submission to the falsehoods of meta-theory.

What also needs to be clarified without further delay is that gender consciousness and feminism, in the generic sense, were not absent in Marxism, and indeed found their edge within the context of its larger theoretical problematic. This is evident in as early as Marx's *German Ideology*, as well as in the works of Simone de Beauvoir. Feminism as an entirely alternative conspectus is of much later vintage, beginning first with Kate Millet and other assorted 'male bashers'. But this variant lacked intellectual prestige though it served to get things out in the open like never before. Bras were burnt, nude marches were staged, and dirty words (once the preserve of males) began to flow unabashedly from the mouths of women.

All this forced many men to take a hard look at themselves, their masculine myths, and the role models they had all along enthusiastically emulated. Even so this brand of feminism was an intellectual cripple, attracting, in the main, mute chain and hangle hands. After males were castrated what were the women to do: become men themselves? This was the only viable activist option which led women to smoke, drink, frequent male strip clubs, and, in some cases, shun men altogether. The potentiality of this line of action was severely limited for it did not give women what they were in their own right. It only made them more like men, and not like the best of them either.

II

Postmodernism changed all this. While feminist activists of the earlier kind had a reputation on the streets, the contemporary feminists are respected members of the academia, adorning board rooms, and presiding over destinies of others – both men and women. Their efforts, ambitions, and projects are now eagerly funded by government and private agencies. In many instances even jobs are specifically designated for women. The Kate Millet variant of feminism

would not have come within a tinted hair's breadth of this kind of exalted reputation. Women could now go back to being women again, but not like the domestic cow of the pre-Kate Millet period. This new woman is assertive, ambitious, and comfortable enough to leave lipstick stains on cigarette filters.

How was all this consolidated by postmodernism? It is not as if the high priests of postmodernism had feminism in mind when they first formulated their views. In fact some postmodernists, like Marcus and Fischer, are criticised by feminists for their patriarchal bias [see Mascia-Lees, Sharpe and Cohen 1989: 9-13]. The main target of the postmodernists is theory, anything foundational, and that is why Marxism is their most preferred whipping boy [see Laclau and Mouffe 1990]. In fact many early postmodernists like Lyotard began their intellectual career as Marxists. Postmodernism first influenced literary studies primarily because its founder, Jacques Derrida, dealt primarily in this field. Beginning with a critique of those who looked for the 'real' meaning in texts (remember the work, *What Marx Really Meant*), Derrida argues that a text does not belong to the original author, or to the first reader, but that its intended authorial meaning is stolen (*souffle*) the moment the sentence is uttered. The Derridean negation of the quest for a focalised meaning, allows multivocal (actually equivocal) readings of texts, where all meanings, no matter how capricious, whether potential or realised, have the same validity.

III

Different disciplines took to this postmodernist postulate in different ways. For some converted political scientists this meant that all activist options were equally legitimate. Some like Richard Rorty believe that this is what makes postmodernism intrinsically democratic in character. As all views are now of equal status, there is no Archimedean point from which an ideology can be either positively or negatively evaluated. Yet, in actual fact, the postmodernist antipathy towards Marxist politics is more trenchantly expressed than what their original starting point should have strictly permitted them to. That many of them, like Lyotard and Laclau, were earlier committed Marxists, may have been one of the major compulsions for such dramatised distancing.

Nevertheless, political science offered some resistance to postmodernism because the real world of power seekers, which is the terrain of political science, is extremely focalised. Enemies, friends, and policies are categorically visualised, without the endless deferral of meaning. The texts of politics are, therefore, not of the kind where all interpretations are equally good, or valid. No

politician can ever risk that, and political scientists too must be sensitive to this limitation.

Some historians influenced by the notion of the deferral of meaning and the fluidity of texts argue that identities in the past were not fixed and stable entities. This is supposed to be in contrast to contemporary times when identities are much more permanent and enduring than what they used to be. Historians have had an easier time with postmodernist views, for it is quite convenient to see historical documents as texts, and also because there are no living people from those times who are around to contradict them. Even so, the very fact that historians are compelled, by the nature of their discipline, to make their documents public, goes against the grain of postmodernism. As public documents there must be a minimum consensus on what it is that validates them as relevant data. But, as Habermas argues, considerations of consensus, no matter how minimal, necessarily bring in issues of context and inter subjectivity. These in turn undermine the postmodernist insistence on a fragmented epistemological order which, ironically enough, has all the markings of a priorism about it. In any case, this can at best leave the historians as only partial postmodernists. But as any postmodernist knows, one cannot be a little bit pregnant.

In anthropology, however, postmodernism found a most generous host. The conditions in which anthropologists practice their discipline is often in isolation from their peers. The anthropologist is in some remote village, or in some dank and dreary rain forest making contact with the 'other'. As it is entirely up to the anthropologist in the field to make sense of this other, and as this other is not the routine self of the anthropologist or of the peer group of certified anthropologists, there is a lot of scope for metaphor, poetry, and literary trope [see Clifford and Marcus 1986; see also Rabinow 1977]. If the world that the other inhabits is distant from our own, and if, with some luck, colleagues from home can be dissuaded from visiting the same place, then that particular field becomes the anthropologist's private Xanadu. It is up to the anthropologist to choose the method of representation. This is why anthropologists get possessive about 'my village', or 'my bushmen'. It is said that Raymond Firth's attachment to his field in Tikopia was so intense that his department earned the sobriquet: 'We, the Tikopians and others'.

The number of postmodern works in anthropology is largely encouraged by this inherent character of the discipline, and the manner in which it is reproduced. The most important feature seems to be able to make the subject of analysis as subjective as possible. Neither history, nor political science can go as far as anthropology in this regard. Economics has so far not even entertained the idea. So of all the social sciences, it is

in anthropology that the postmodern tendency is the strongest. It is therefore not at all surprising that feminists should borrow freely from this discipline, either from within or from without.

IV

Interestingly it is also in anthropology, or social anthropology (as taught in most sociology departments in India), where the 'blame your own discipline' syndrome seems to be the strongest today. As mentioned earlier, to a great extent this is an outcome of the fact that the field often loses its objectivity in anthropological investigations. As nobody else is likely to ever go to the same locale, or as nobody from the department can question the veracity of the findings, the field really becomes a personal possession, above questioning. This is also why it is possible to argue, as some indeed have done, that there is no such thing called 'society', for all concepts of this order, *pace* postmodernism, are creations of the mind, and hence, 'fictions'.

But this immediately leads to objections. Society is not a word that only those who go to Bongo Bongo employ with respect to the local residents. It is also a term that urban and industrial sociologists use; it is also used by economists and demographers; it is employed in addition by lay persons, politicians, members of the civil society, and so forth. The term society cannot therefore become one's individual preserve the way Tikopia or Samoa can be. To make matters more difficult there are now enough people in 'Bongo Bongo' who are writing about themselves and can also read what other people have written about them. There is unprecedented scope now for the subjects to talk back. In this way the anthropologists' capricious monopoly of the field does not always go unchallenged.

It is for this reason that sociology (and social anthropology), contrary to the general impression, is a very difficult subject to practice. Unlike economics, or history, or political science whose field can be objectified, in sociology it is up to the scholar concerned to come up with a research agenda which is above the level of interesting gossip or privatised obsession/vision. For, in the ultimate analysis, a discipline can perpetuate itself as one only if its practitioners can rise above pure subjectivity. It is only then that the minimum conditions of arriving at consensus are present, whether or not the consensus is actually arrived at. In this sense then a tendency that privatises the object of analysis can only do so on pain of undermining disciplinary specifics. No matter how attractive it might appear to knock down disciplines, the truth is that objective consensus cannot be arrived at without disciplinary grids.

In my view this is why theories are important too. Theories force the subjective to come out in the open and communicate

with others in a situation of simulated objectivity. Simulated because nothing is objective in the absolute sense of the term, but it is still possible to agree on the legitimacy of certain kinds of facts which are above the strictly personal and can thus be obtained without recourse to poetry, metaphor, or trope. This is also why theories set out in advance their areas of competence, as also the order of facts necessary for their demonstration. But no theory lives in its own world, but has to contest with other theories. If this contest is held in terms of incommensurable qualities then no advance, no communication, and no consensus can ever be conceived. A theory is a theory because it is open to other theories, and, *de jure*, willing to retreat if the agreed upon order of facts are openly hostile to it.

While it is true that one brand of anthropology openly flouts theory in favour of poetics, the concept of society, as discussed earlier, cannot be dismissed quite that easily as 'fiction'. Thus while most branches of social sciences were influenced by postmodernism, it was difficult in all cases to yield completely to postmodernist directives. Except feminist studies!

V

Feminist studies today are closest to postmodernism in spirit than probably what most feminist might be consciously aware of [see Heckman 1990]. Spivak, for example, points out that her reading of Lacan is the same as that of Jacqueline Rose, though the former is an out and out Derridean, and the latter is perhaps a structuralist [Spivak 1989:208]. As is commonly acknowledged, it was the disenchantment with Marxism, and the failure of so-called Marxist regimes, that gave postmodernism its appeal. Feminism too was struggling for recognition around the same time, for Marxism was till then its principal theoretical support. When the credibility of Marxism collapsed, feminism was left with no post to lean against. In the meanwhile, however, with the process of secularisation women were making great strides in different walks of life, without, however, being able to challenge the *de facto* domination of patriarchal ideologies. That men had begun to be pushed back in a variety of fields was obvious, and Beteille has recently remarked on this trend with respect to the academia [Beteille 1994]. But it is not only in universities, but elsewhere too, though perhaps less noticeably, that women were beginning to come into their own. Yet everywhere they encountered a troublesome resistance from the pervasiveness of a patriarchal mind-set which seemed so anachronistic.

Neither could Kate Millet, or her official think-alikes, be dusted out of the cupboard, for that too would be a trifle anachronistic. At this point postmodernism showed the way, and feminist studies responded to all its cues with alacrity. When the post-

modernists said that science was basically meta-theory pompously churning out fictions, the feminists matched it by arguing that the theoretical articulations, as say those of Freud [Whitford 1989] or of Lacan [Spivak 1989], or Descartes [Bordo 1986] were basically phallogocentric in character. The fit between contemporary feminism and post-modernism is best expressed in the pages of *Signs*, the most prestigious journal today on the subject of gender studies.

The theories that the feminists took up for scrutiny were, in their eyes, not just fictions, but male fantasies. As Sandra Harding says without mincing words: "...theorising itself is suspiciously patriarchal, for it assumes separations between the knower and the known, subject and object ..." [Harding 1986:647]. Social theories thus faced the possibility of being doubly damned in the hands of feminists. The more opprobrium one could heap on a hated object, the more definite one could be that it would die writhing in disrepute.

The next step was to make the feminine body analogous to the Derridean text. Unlike the feminists of the past who wanted to be like men, their contemporary counterparts realised that somehow that missed the point. The male model was not as liberating as they thought it would be. There was something about being a woman which was not just masculinity denied. Science too was pumping away with information along these lines, demonstrating that the differences in gender is not always an outcome of socialisation. When women frequent male strip joints they loudly laugh and cheer during the show. This is quite in contrast to the hushed silence among men when a female stripper is belting (or unbelted) her stuff. The men look at the show in numbed silence. They cheer only after the show is over, but never without a significant pause when they are collecting themselves. That women are not a mirror image of men is clearly demonstrated through this one illustration. The dissatisfaction with the male model was being increasingly felt by contemporary women, and that is why the Derridean notion of a text was so quickly seized by them to substantiate their singularity and difference.

VI

Luce Irigaray, a leading feminist scholar, reflects upon this situation in the following way. After demonstrating the phallogocentric limitations of male views of female sexuality where the woman is passive, something to be enjoyed by others but never enjoying herself, she goes on to demonstrate how the sexual distribution of erogenous zones makes for the different ways in which men and women think. For men sex is focalised around a pre-eminent organ whose satisfaction is primary. A woman on the other hand "has sex organs more or less everywhere" [Irigaray 1985:28; emphasis in original]. She goes on to say: "Even if we refrain from invoking

the hystericalisation of her entire body, the geography of her pleasure is far more diversified, more complex, more subtle, than is commonly imagined..." (ibid).

But this distribution of erogenous zones is not just relevant in terms of female sexual pleasure, but also accounts for the way women think, talk, and generally present themselves. As they lack a focalised competence in sex, and as their sexual topography is distributed, women also appear to men to be "whimsical, incomprehensible, agitated, capricious...not to mention her language, in which 'she' gets off in all directions leaving 'him' unable to discern the coherence of any meaning. Hers are contradictory words, somewhat mad from the standpoint of reason, inaudible for whoever listens to them with ready-made grids, with a fully elaborated code in hand" (ibid:28-29). Little wonder then why men continue to misunderstand women. Men function with a focalised 'grid', much the same way as they have focalised sex, whereas women say a word here, stray away elsewhere, return again but never in an identical fashion, but just 'touches upon' (ibid:29), and then breaks off and starts again "at 'zero': her body sex" (ibid:29).

This may sound very much like a rehash of 'anatomy is destiny', but the express purpose is of a very different order. The woman's body is quite explicitly like a Derridean text in more ways than one. There is no privileged single point of pleasure, but that there are several points and they are dispersed all over. No one zone is erogenously superior to the other, and all of them have roughly the same status. This is analogous to the Derridean view that texts can have different meanings and that no one meaning can enjoy pre-eminence over the others. And like Derrida who argues that writing, as in all texts, leaves behind an *arche*, or a trace of past inscriptions, so also does Irigaray contend, that when women say something it is not identical with anything they might have said before, except just to 'touch upon' earlier ground. These qualities in a woman are peculiar to her and are of a piece with her sexual topography.

VII

This brings us to the next characteristic feature of contemporary feminist studies. This has to do with the tendency to make women so distinctly unique that general methods of intersubjective enquiry are rendered meaningless. As feminist studies clearly privilege the female 'voice', intersubjectivity is methodologically and purposively curtailed. But intersubjectivity curtailed is in essence intersubjectivity denied, which is why feminists have succeeded so well in converting the woman and her sex into a Derridean text [see Moi 1985; also Berg 1991:55].

Contrast this with the mixed reception that postmodern anthropologists received in their

attempts to privatise the field and insulate it from intersubjectivity. As may be recalled, this was largely because the concept of *society* could not be unequivocally made into a Derridean text. In postmodern understanding, a text is open to equivocality and, therefore, there is no question of getting to the 'truth'. Feminists, likewise, reject the possibility of 'truth', and believe that a normal science paradigm which demands intersubjectivity is no better than a patriarchal delusion [Harding 1986:649]. According to Harding, feminist categories should necessarily be 'unstable' (ibid), so that epistemological problems can be "resolved by appeals to the *authority of the body*" [Hawkesworth 1989:547; emphasis mine]: the female body, no doubt. Therefore, it is no longer possible to comment on this text from the outside, for how does anyone but a woman know what it is to have a dispersed sexual topography? This is why women should write about themselves - *l'écriture féminine* [Mascea-Lees, Sharpe and Cohen: 1989:13] - for it is the uniqueness of their experience which is most critical [Hawkesworth 1989:544]. It is only through the "...knowledge that we ourselves produce" [Nash 1994:69], that the "heterosexual matrix" [Butler 1990:145] can be dismantled.

VIII

Thus apart from Irigaray's rather extreme, but nevertheless singularly influential 'vulvomorphism' [Berg 1991:56], the subjective textualising of the female body is widely subscribed to by several mainline feminists. In textualisings of this sort there is no scope to reach consensus, or even begin a discussion with those who are of a different sex. As methodological relativism too is suspiciously 'androcentric' [Harding 1987:10] in nature, there are no grounds for upholding separate values either - one male, another female. There is therefore unlimited metonymy of feminine expression and experience, but all of these are well outside the reach of intersubjectivity. This situation resembles Lacan's notion of *jouissance* [Lacan 1977] when a dyadic face off (in this case between the sexes) continues endlessly without any resolution. Of course, Lacan saw this as a pathological phenomenon, but for the feminists this is a desired state of affairs. Even Dorothy Smith, who is a somewhat unusual feminist because she has not yet abandoned objectivity entirely, nevertheless also textualises the body. In her view it is the 'insider's knowledge' of a woman that can alone successfully expose the power play in traditional social practices which invariably, without exception, echo the male voice [Smith 1990]. To go back to Irigaray, there is a significant lack in the female *imaginary*, which is why she argues that the mother-daughter relationship has remained unsymbolised [Irigaray 1985:114]. In her view this is in stark contrast to the masculine domain where symbolism is highly

developed. It seems quite justified then to condemn all varieties of established social practices as representing the male voice. The female voice, to go back to Irigaray, lies scattered in 'scraps' and 'uncollected debris' (ibid).

When Simone de Beauvoir wrote about women in *The Second Sex*, it is true that she pointed out, among other things, to the biological differences between men and women. But her intention was not to smash the 'heterosexual matrix' as it was to bring about a more meaningful communication between the sexes. The fact that a woman's body is burdened by reproductive organs, while men travel comparatively light, is dwelt upon by de Beauvoir to demonstrate the specific problems of womanhood, but not in a fashion that separates feminine comprehension from those of men. The contemporary high feminist mode of argument is however inherently different. If women's bodies are like texts then not only does it imply that women cannot be apprehended by theory, but also that it is important to be a woman to know a woman, who in turn is never fully knowable.

IX

Where does this leave men? It is not as if feminists today are made up of women alone. There are a large number of men who are feminists and the number is increasing. It may seem surprising that this is so, but male partisanship with feminist studies actually stems from their postmodern inclinations. And as postmodernism has found its fullest expression in feminist scholarship these men naturally gravitate in that direction. Yet, a man cannot be a woman with a woman's sensitivities. It is not surprising then that the men who want to be feminists wear such pained and anguished looks, which they attempt to pass off as concern. This is hardly convincing especially since the women are so upbeat, especially after having converted their own bodies to texts which is impenetrable by theory.

Thus being left on the outside by the very nature of the 'text', makes these concerned men passive and unable to link with neither women nor with other men. These men have also given up theory, or feminified it sufficiently to justify that texts can only be deconstructed. As their own bodies are notoriously focalised they can only vicariously, and thus incompletely, participate in something that the women do fully, even joyously! Men respond under this pressure by suspending judgment. So that if a man's wife, or girl friend, or mother, calls him a chauvinist, he would slink into his hole and lick his wounds in shameful solitude. As Robert Bly says, if such a man "were a bullfighter, he would remain where he was when the bull charges, would not even wave his shirt or turn his body, and the horn would go directly in. After each fight friends have

to carry him on their shoulders to the hospital" (Bly 1992:63).

As the subject of feminist, or gender studies, has now been transformed into a text, the inclination quite naturally is to study women in only highly stylised situations. This is what makes it even more painful for the men in this group. Feminist scholarship will typically ignore those areas where women interface with men. Feminists are not interested in investigating women entrepreneurs, nor do they want to study models and the fashion industry, nor the world of prostitutes and of the boudoir. Perhaps because in all these areas men are present in very significant, and even in complementary ways. As men are intrinsically a part of such scenarios it undermines the feminists' freedom to textualise the body.

Feminist studies are, therefore, largely about how women give life, about how they know about life, about childbirth, about menstruation, about suffering without adequate symbols, or even about the joys of lesbianism. In none of these can men make any contribution, for these themes when not biologically tied to women, are made analogous to the body. Giving life is after all a wondrous process, as open ended as the female sexual topography. When men enter the picture in such women's studies they do so as objects of hate. They are wife beaters, wife burners, cruel fathers, and untrustworthy companions. That is why every man who has first sold himself to postmodernism in a fit of anti-Marxist euphoria, and then by the principle of elective affinity sides with contemporary feminism, can never be too sure when that slightest slip will show him up as a chauvinist. Such a person is perennially afraid, but there is no out here! As feminist studies have been the most successful carriers of the 'textual' revolution, men must wear that pained look and carry it off like martyrs.

Those other women, who are neither postmodernists in the complete sense of the term, nor feminists, and who examine women in fields other than life, birth, wife battering, etc, find themselves outside this charmed feminist sorority, in spite of their correct gender. These women function in a world of theory and of intersubjectivity, where comprehension of the subject matter does not have to depend upon privileged access made available by birth and biology. This is why this paper is called the feminification of theory, and not the feminisation of theory. This is to signal the fact that there are lots of anguished men in feminist circles, and a lot of confident women outside it. The feminification of theory draws attention to the fact that the postmodern insistence of reading everything as text finds its fullest efflorescence in the domain of feminist studies. Regardless of gender, the postmodern credo encourages a partisanship towards contemporary feminist scholarship, and a concomitant downgrading of both theory

and conceptual and disciplinary rigour. This tendency can be exemplified from the writings of someone like Julia Kristeva. She began her career as a structuralist, but was also a bit feminist on the side. Her subsequent transition to postmodernism gave her feminist inclinations full wing. This is why she can now calmly proclaim that the category 'woman' is a fiction [Kristeva 1986], without ever consulting the men about it.

Practice of Sociology in India

Ramachandra Guha

Themes and Perspectives in Indian Sociology by D N Dhanagare; Rawat Publishers, Jaipur, 1993; pp 203, Rs 200.

IN his book *What Is History?* published in 1961, E H Carr had remarked that "the more sociological history becomes, and the more historical sociology, the better it is for both". Five years later, an Indonesian scholar more sharply focused on the relationship between the two disciplines, writing that "the one subject matter which certainly does exhibit the actual or potential interdependence of history and sociology is the social movement". This was Sartono Kartodirdjo, in the preface to his great work, *The Peasants' Revolt of Banten in 1888*. Sartono's book, which anticipated by a decade and a half the methodological concerns and research agenda of the subaltern studies movement, was to provide stunning proof of the potential interdependence of history and sociology.

I do not know whether Sartono had read E H Carr, or whether D N Dhanagare has read Sartono. But Dhanagare's book, *Peasant Movements in India*, which appeared in 1983, likewise used the social movement to effectively bring together two disciplines that, in the Indian context, previously had little to do with each other. Dhanagare is, of course, a sociologist. In the same year, 1983, was published Ranajit Guha's *Elementary Aspects of Peasant Insurgency in India*, which represented the first sustained attempt by a historian of India to use the concepts and findings of sociology and social anthropology. The simultaneous publication of these two books then seemed a hopeful augury for the future relations between history and sociology (an optimism that, in retrospect, seems to have been misplaced).

Dhanagare's new book brings together essays written between 1980 and 1990. Although disparate in style, length, and subject matter, all deal, in one way or another, with the practice of sociology in India. Dhanagare defines himself as an 'outsider within', that is, a sociologist who was trained not in the major centres of Delhi, Lucknow and Bombay but in the backwater that is Nagpur. It struck me that both S C Dube and Ashis Nandy, who have likewise made important contributions to Indian sociology, were also trained in Nagpur – a connection Dhanagare might have commented upon. Perhaps there is a case to be made that the city which is closest to the geographical centre of India should henceforth be considered a fourth 'centre' of sociological research.

But Dhanagare is an outsider within Indian sociology in another sense too. His chosen topics of research, social movements and social conflict, have been more than marginal to the discipline. As he notes wryly, "however eminent an Indian sociologist might be 'the sociology establishment' in India rarely considered him literate enough to be invited to seminars if he had not studied either 'kinship structure', 'caste' or at least a 'village'".

The essays in this book fall neatly into two groups. One set of shorter essays offer general, and more or less unmediated reflections on the author's discipline; a second set of longer and (to this reader) more satisfying ones use specific individuals and spheres of research to comment on the state of sociology. In the first group fall Chapter 2, a sort of manifesto, first published in *Seminar*, which asks sociologists to become more committed, to study social transformation from the perspective of the masses rather than the elite; Chapter 4, which uses analogies from the natural sciences to point to the possibilities of interdisciplinary work; and Chapter 8, on the relevance of sociology, which begins with a plea for methodological pluralism and ends by noting the contradictory influence of the state and action groups on research agendas.

Chapter 3, the first of the longer essays, provides a historical survey of the development of sociology and social anthropology in India. The account is thorough and reasonably complete, and (as an admirer of the man) I was especially pleased by the acknowledgement that Radhakamal Mukherjee "was the pioneer of a transdisciplinary approach in Indian social science". This narrative follows previous surveys in tracing the development of a discipline through the founding of university departments of sociology and the role played by influential teachers within them. That is its strength and perhaps also its weakness. Thus Dhanagare, like his predecessors, pays little attention to scholars who were, in terms of their institutional location, 'outsiders within' or even 'outsiders outside', and yet made significant scholarly contributions. I think especially of N K Bose, who gets one fleeting mention here, and Verrier Elwin and Patrick Geddes, who are not mentioned at all (the latter despite having been, briefly, the first Professor of Sociology in India).

Chapter 5, first published in the *Sociological Bulletin*, introduces the ideas and work of the late D D Kosambi to an audience of sociologists. This is a clear presentation of Kosambi as a creative historian who used a Marxist approach without mechanically following the master – thus his abrupt, and justified, dismissal of Marx's notion of the Asiatic Mode of Production. Dhanagare identifies the source of Kosambi's creativity in his conviction that "neither Indian scriptures nor Marxism are sacrosanct". He also points, perceptively, to the contrast between the historian's brilliant analysis of ancient and medieval India and his unoriginal comments on the 'bourgeois' epoch of Indian history – unoriginal because they appear to be derived from the work of R P Dutt, a vastly inferior thinker.

Chapter 6 provides an extended assessment of Ranajit Guha's work on peasant insurgency. "In the din over the polemical aspects of the concept of 'subalternity'", writes Dhanagare, "the deeper insights and distinct analytical approach Guha's own study has offered have been lost sight of". For, the value of Guha's paradigmatic forms of insurgency – negation, ambiguity, modality, solidarity, transmission, and territoriality – "remains undiminished regardless of whether we accept or eliminate the 'subaltern' concept from his framework". This is unexceptionable: 'subaltern' is a polemical category, with little explanatory value, whereas Guha's 'elementary aspects' provide a suggestive way of reading violent rebellion. However, Dhanagare seems to have misunderstood Ranajit Guha's remarks on spontaneity – these do not, as he mistakenly suggests, "emphasise the role of pure spontaneity of the action of subaltern masses in history". On the contrary, following Gramsci, Guha argues that there is *no room* for pure spontaneity in history: even allegedly 'pre-political' actions are informed by a distinct ideology and worldview – they are emphatically closer to culture than to nature.

This assessment of Ranajit Guha's work ends by noting its limited usefulness in interpreting social protest in the post-colonial period. Since 1947, collective action, by farmers, workers and other social groupings, has been widespread, yet violent insurrections have been infrequent. These movements, in a democratic but grossly inequitable nation, might be understood in terms of a 'revolution of rising expectations', and thus amenable to analysis through the lens of 'populism' rather than 'subalternity' or 'insurgency'. This discrimination comes from a distinctive strength of Dhanagare's work – its challenge to the Lakshman Rekha of August 15, 1947, a line which supposedly divides colonialism from independence, in

political terms, and history from sociology, in terms of scholarly practice.

The following chapter also has the author moving back and forth across this divide. Here he provides a valuable historical perspective to the theory of non-party political formations, put forward by Rajni Kothari, D L Sheth, Harsh Sethi, and others. He remarks on the diversity of action groups in the colonial period – Gandhian *swaraj* ashrams, groups for women's uplift, left wing organisation among lower castes and tribals – pointing out that these formed an integral part of the party political process. By contrast, the leadership of action groups in the present most often comes not from party workers, of left, centre or right, but from alienated middle class intellectuals who, in a previous age, would have gravitated more easily to the Congress or the communists.

The diversity of essays notwithstanding, the book is underpinned by three arguments about, or more accurately, three charges against his fellow sociologists: the atheoretical or even anti-theoretical nature of their research, the relative lack of attention paid by them to social conflicts and social movements, and their continuing neglect of history. The second and third charges are cogently put forward and are, on the whole, persuasive, but I am not in entire agreement with the first. A recurring plaint here is that

Indian sociologists either uncritically use western concepts or are too mired in the micro reality of one village or one caste, 'not rising above it in order to enter the realm of theorisation and conceptualisation...'. While this might be a fair assessment with respect to the bulk of Indian sociologists, I believe that Dhanagare has insufficiently acknowledged the theoretical and conceptual contributions of two scholars, in particular: M N Srinivas, whose ideas of the vote bank, dominant caste, and Sanskritisation all provide penetrating and original insights into the dynamics of Indian society; and Andre Beteille, who has made major contributions to comparative sociology, notably through his work on power and inequality.

These disagreements might remain, but there is one comment that Dhanagare might wish to disown, or at least clarify, in a future edition of his book. He remarked, in 1989, 'We [sociologists] have overdone 'caste' so far; let us explore the 'class' underpinnings of what are seemingly 'caste-relations, caste-conflicts and caste-atrocities' ". This was written as the Mandal report was being tabled – in a post-Mandal world, the Marxists were first in the rush to abandon 'class' for 'caste'. We knew that sociology is not a science, insofar as it cannot predict the future; it might now be acknowledged that sociology cannot even predict its own future.

set at rest the fears of the Sinhalese.

This book is a collection of five papers prepared under a research programme undertaken by the International Centre for Ethnic Studies in Colombo in order to study the newly established, provincial councils system of Sri Lanka. The experiment in the north-east, the focus of ethnic conflict, proved short-lived. Established in November-December 1989, in somewhat dubious circumstances, it was dissolved by the central government in March 1990. Elsewhere the councils function.

The research project undertook studies under three categories: (a) An exercise in monitoring the actual process of implementing the devolution scheme under the provincial councils system; (b) a study of the historical background against which the process of centralisation of the state as well as processes towards devolution have occurred in Sri Lanka; and (c) studies on certain specific aspects of the devolutionary process in the present context.

As in India and Pakistan, the men who wielded power in Sri Lanka after it became independent identified nationalism with strong central authority. The intensity of the conflicts that followed in the three countries varies, of course. But in each indifference to autonomy of the regions and to minority rights eventually impaired the centre. A researcher at the Centre for Ethnic Studies, Jani de Silva's paper 'Centripetal Pressures and Regime Change in Post-Colonial Sri Lanka' shows how the process of centralisation contributed to the rise of authoritarianism, a phenomenon that did not spare India and Pakistan either. Centralisation militates against power-sharing and without power-sharing no plural society can function democratically for long.

The historical background to the present experiment in devolution is described in a paper by Jayadeva Uyangoda, senior lecturer, Department of History and Political Science, University of Colombo. It highlights the conflicting Sinhala-Tamil perceptions of devolution over the years. The Bandaranaike-Chelvanayakam Pact of 1957 and the Senanayake-Chelvanayakam Pact of 1965 collapsed because in each case Sinhala reaction forced the prime minister of the day to repudiate the pact. The author points out,

In the Sinhalese ideological making of the Sri Lankan state, there is a powerful idea of Sri Lanka being 'our land' – *ape rata*. This territorial possessionist idiom in the Sinhalese political discourse implies a condition of social appropriation of the state which is mediated by ideology.

The 'ourness' of the state – a deep sense of the possession of the land and its political order – can be seen as having profound implications for the political debate concerning the institutional nature of the modern Sri Lankan state.

Challenge of Power-Sharing in Sri Lanka

A G Noorani

Devolution and Development in Sri Lanka edited by Sunil Bastian; International Centre for Ethnic Studies, Colombo, Sri Lanka, in association with Konark Publishers, New Delhi, 1995.

INDIAN constitutional lawyers and political scientists should watch Sri Lanka as it confronts two major challenges today. One is constitutional renewal, the drafting of a Constitution which restores the parliamentary system without reducing the president to a stooge of the prime minister. The other is a solution to the Sinhala-Tamil question. The two are closely interlinked. The Bandaranaike constitution made the president removable at the whim of the prime minister. The Jayawardene constitution established a presidential system, supposedly based on the French model, shorn of important checks on power. Each was tailored to suit the figure of the leader of the regime of the day. Neither was based on a national consensus.

Any solution to the ethnic problem, if it is to last, must enjoy support from both communities and must be entrenched in the new constitution. It is a daunting task but not an impossible one. It is certainly a noble one to undertake. The constitutional requirement of a two-thirds vote of the national assembly and a referendum make consensus

imperative (Articles 82 and 83). Devolution of power is the key to the solution of the ethnic problem as also to constitutional renewal.

In recent months two significant shifts of opinion have taken place. The LTTE has hinted that it is prepared to give up Eelam if a satisfactory system of devolution is evolved. Very many among the Sinhalese have come to accept devolution. For all their limitations and inadequacies, the provincial councils have come to stay. Not long ago they were viewed with suspicion by Sinhalese as a first step to secession.

The Thirteenth Amendment to the Constitution, enacted in November 1987 pursuant to the Indo-Sri Lankan Accord, and the legislation that followed in its train, the Provincial Councils Act, 1987 and the Provincial Councils (Consequential Provisions) Act of 1989, imposed crippling limitations on the autonomy of the provinces. But they opened an avenue. Discussion now centres on how best to improve them so as to satisfy the aspirations of the Tamils and

The BJP's stance on Indian federalism is no different, except in conflicts between BJP-ruled states and the centre. In each case the standard question raised is "How can 'our' state power be shared with an ethnic 'other'?" This was the mind-set behind Russian domination of the Soviet Union and Serb domination of Yugoslavia.

Amita Shastri, associate professor, Department of Political Science, San Francisco State University, poses the question whether the present provincial council system can provide a solution to the ethnic problem. In their existing form, obviously not. But their potentialities must not be underestimated. However, as the paper shows, a lot depends on the inclination of the president. J R Jayawardene was keen on devolution while Ranasinghe Premadasa was hostile to it. It is a reflection on the fragility of the system if its working depends on the will of the centre. Autonomy, to be true to its name, must be independent of the centre and derive its sanction from the Constitution.

This is not to suggest that constitutional provisions are all. Autonomy is a product of a mix of the law and politics. In the late 1980s, Rajiv Gandhi tried to by-pass non-Congress(I) governments to reach out to local bodies. Collectors were summoned to conferences without so much as intimation to the state governments. In Sri Lanka the same tactic was employed by Premadasa, as the paper notes: "The Gramodaya Mandalayas at the village level and the elected Pradeshiya Sabhas at the sub-district level in rural areas were created at his behest in the early 1980s to undergird the newly created District Development Councils."

The editor of the volume, a researcher at the Centre for Ethnic Studies, has contributed a paper on 'Liberalised Policies and Regional Autonomy' as well as an Introduction which knits the papers together. He demonstrates how, contrary to impressions formed by some, "implementation of the liberalised package also means a high degree of central control of major economic decisions. In order to carry out controversial economic decisions, there has been a high degree of centralisation".

Radhika Coomaraswamy, a director of the centre and author of the famous book, *Sri Lanka: The Crisis of the Anglo-American Constitutional Traditions in a Developing Society*, has written an incisive analysis of the role of the judiciary, entitled 'Devolution, the Law and Judicial Construction' which Indian constitutional lawyers ought to read in particular. She has contrasted the judiciary's response to the Sixth Amendment of 1983, which outlawed the cry for a separate state and proscribed even moderates like the TULF, and the Thirteenth Amendment of 1987 which established provincial councils.

The paper sets out the background and the issues raised by the inadequacies of the existing councils; not least concerning

their powers over land, internal security and, indeed, their sources of finance.

The Supreme Court of Sri Lanka readily upheld the Sixth Amendment enacted in the wake of the upheavals of 1983. Its response to the Thirteenth Amendment was divided:

One school of argument is, of course, that the Thirteenth Amendment, passed in 1987, was a fundamental structural change and therefore more offensive to the Constitution than the 1983 Amendment. In addition, the Indian factor made the court acutely aware that the executive decision may not have been 'free' and 'democratic'.

The other line of argument is that the courts are made up of judges and that they share the opinions of fellow citizens, the judicial notice of those opinions and prejudices is inbuilt and often comes to the fore in times of emergency. In the context of ethnic war, those opinions must inevitably represent the will of the majority community, even more than deference to the executive.

Students of the Supreme Courts of India and Pakistan will find parallels nearer home. One is reminded of Cardozo's famous aporism in his classic *The Nature of the Judicial Process*: "The great tides and currents which engulf the rest of men do not turn aside in their course and pass the judges by" (p 168). Coomaraswamy writes: "It has always been argued that the Supreme Court is the real safety valve for minority grievances. This line of reasoning has to some extent succeeded in India, the UK and the US with the judiciary taking the lead in cases involving ethnic minorities. But in Sri Lanka, the nature of the crisis has been far too acute for detached judicial decision making."

India's experience has not been particularly different. Justice V R Krishna Iyer once angrily remarked "The judiciary will be described as the villain of the piece", on the Ayodhya issue. In his view it lacked the guts to face the issue (*The Times of India*, November 11, 1989). The Supreme Court's rulings on the Aligarh Muslim University and the Ayodhya reference are none too inspiring. The belated conviction for contempt of court of Kalyan Singh by chief justice M N Venkatachaliah in October 1994, two years after the offence was committed, does little credit to the Court (vide this writer's critiques of these rulings in *The Statesman*, November 7-8, 1994 and January 18-20, 1995).

Three judges of the Supreme Court of Sri Lanka, including the chief justice, accepted the Thirteenth Amendment as valid and not contradicting the unitary provisions of the Constitution and, therefore, not requiring a referendum. They held that parliament could override provincial legislation. The dissenting judges regarded the amendment as a devious stratagem to introduce federalism by the back-door (Wanasundera and Seneviratne JJ). Radhika Coomaraswamy is critical of the reasoning of both the majority

as well as the minority, albeit more of the latter and deservedly so. She recalls:

Both Wanasundera and Seneviratne pointed to the fact that Buddhist relics in the North and East would not be protected and Wanasundera also argued against Tamil being made an official language. 'It is a matter which I cannot avoid dealing with... the joinder of the Northern and Eastern provinces and the official recognition of the traditional homelands of the Tamils will toll the death-knell of the Sinhala people in those provinces. There is an undertone of this fear in all the petitions opposing the Bills. Even the most naive of people could not expect a single Sinhalese to go back to the North and/or East if the maintenance of law and order within those areas becomes the exclusive preserve of the political leaders and patrons of the very terrorists who chased them out.'

The judgment of the dissent was by no means 'ethnic blind', for the judge added:

Sinhala as the official language in the country (with the reasonable use of Tamil in Northern and Eastern Provinces and by Tamils) has been the major plank in the manifestos of the leading Sinhala political parties throughout the last four decades. It has been submitted that such a fundamental change cannot be effected without consulting the people.

There is hope, however. Once devolution is accepted and entrenched in a new constitution, the judiciary will respond to the changed climate. Finley Peter Dunne's *bon mot* is as true of the supreme courts of south Asia as it is to that of the US: "No matter whether the Constitution follows the flag or not, the Supreme Court follows the illicit return".

CENTRE FOR DEVELOPMENT STUDIES

Ullor, Thiruvananthapuram 695 011, KERALA.
Tel: 448881 Fax: 447137 Tlx: 435-227 CDS IN

M.Phil Programme in Applied Economics, 1995-96

Applications are invited for admission to the Centre's M.Phil Programme in Applied Economics, 1995-96, affiliated to the Jawaharlal Nehru University, New Delhi, commencing on July 14, 1995.

- This fully residential programme is designed to provide a broad based understanding of economic theory and Indian economic problems, as well as, adequate analytical skills for research in applied economics.
- The programme has an inter-disciplinary approach (prior formal training in economics is not considered essential) and the minimum qualification for admission is a Masters Degree or equivalent in any discipline with a minimum of 50% marks. Those who are awaiting the results of their qualifying examinations can also apply. The selection is made on an all-India basis. A maximum of 15 persons are selected each year.
- Selection of the candidates will be based on their academic record, quality of the research proposal submitted along with application and a personal interview.
- Fellowships with a monthly stipend of Rs. 800 and a lumpsum contingency grant of Rs. 1500 will be available to all the selected candidates. One Fellowship, instituted by JET, Bangalore, is available for working journalists.

The Prospectus and Application Form can be obtained from the Registrar, CDS. Completed applications should reach the CDS, latest by May 22, 1995.

March 20, 1995

DIRECTOR

APPOINTMENTS

INDIAN INSTITUTE OF MANAGEMENT AHMEDABAD

invites applications for

FACULTY

In the following Areas/Centres/Groups

Business Policy, Centre for Management in Agriculture, Computer & Information Systems, Economics, Entrepreneurship, Finance & Accounting, Industrial Policy Management, International Management, Marketing, Organizational Behaviour, Personnel & Industrial Relations, Production & Quantitative Methods, Public Systems Group, Ravi Matthal Centre for Educational Innovations

IIMA offers Masters and Doctoral level programmes. The faculty undertake individual and group research, participate in management development programmes and get involved in consulting assignments.

Qualifications

A Ph. D. in Management, Social Sciences, Engineering or any allied discipline is a necessary requirement. Post-doctoral experience in teaching/research in educational institutes or industry and a record of publications in refereed journals will be added qualifications.

Faculty may be taken at the level of Assistant Professor, Associate Professor, and Professor depending on the experience. Age of superannuation is 60 years.

Benefits

In addition to the salary and usual allowances admissible within the prescribed government scale for faculty (which are currently comparable with senior appointments in Government of India), faculty are allowed the privilege of consulting, income from which is shared between faculty and the Institute according to IIMA norms. IIMA has a green campus spread over 65 acres. New faculty can expect to stay in campus houses soon after they join. Rent is highly subsidised.

Interested candidates may send their applications to:

Director, Indian Institute of Management, Vastrapur, Ahmedabad 380 015.

Globalisation and Revival of Tradition

Dual Attack on Model of Democratic Nation Building

Rajni Kothari

With the advent of globalisation, the changes taking place at the bottom tiers of nations have received little attention. Yet shifts in power relations, allegiances and consciousness at various levels of civil societies are changing the world as much, if not more, than the macro changes wrought by international capital, technology and the mass media. To what extent will these new cultural assertions of identity enable the peoples of various regions to face the new capitalist order, remains to be seen.

WITH the advent of globalisation, its impact on the mass media and other catalysts of what is called informed opinion as well as the wide acceptance of its logic by national elites round the world, the no less momentous changes taking place at the bottom tiers of nations and civil societies have received very little attention. Yet one is witness to quite far-reaching shifts in power and allegiances within diverse regions, nations and peoples bringing in their wake new responses, newly perceived interests and new modes of interaction between hitherto dormant cultures and nations and still dominant centres of power and control over resources. There are soundings of a new consciousness at different thresholds of civil societies and newly emerging political formations that are producing new power equations at various levels of existing states, engendering new social mobilities and cultural assertions both within and outside existing institutional spaces, together positing a new and hitherto unanticipated unfolding of the human enterprise. The world we are living in is being changed as much, if not more, by the deeper stirrings in the structure of civil societies as by the 'macro' changes wrought by international capital, trade, technology and the mass media.

Ironically, these stirrings of both consciousness and politics at the mass level are taking place in countries and regions whose ruling elites are displaying increasingly nervous, trepid and inferiority-ridden attitudes, internally reflected in a decline in democratic commitment and growth in repression – state shorn of vision and confidence must turn oppressive – alongside turning chauvinistic vis-à-vis national peripheries and weak neighbours while externally becoming vulnerable to a variety of pressures and conditionalities.

Meanwhile the global structures of domination and control themselves are shifting from being located in powerful nation states to being techno-economic consolidations of resources, both natural and managerial. With this the nature of the international order is found to be shifting gears – the relationships of domination and dependence are moving from being mainly geopolitical to being

mainly technocratic; national and regional diplomacy is being asked to handle completely new issues like trade, patent regimes and global property rights for which it is hardly prepared and for which it has to borrow skills and expertise from the same dominant centres with which it is trying to come to grips. Far more resources and national and international infrastructures are at the command of transnationals than of nation states. A hegemonical and hegemony-seeking US may want pliancy on the nuclear front or in respect of peace settlements in various regions under its overall auspices, but these are hardly matters of great relevance to the emerging configuration of transnational power (the giant corporations on the one hand and the Bretton Woods institutions on the other), that happen to be less and less political and tend to render the political actors – from the hegemonic US to the newly liberated South Africa and the Palestinian homelands – to run to them for succour.

It is this new nexus of finance, trade and technology that is likely to both directly and indirectly affect the coming generation of leaders and peoples in all regions as they seek out new futures in the next millennium. These latter are likely to face not just a drastically altered structure of relations between states but also a considerably changed nature of the capitalist order in which they will be willy-nilly asked to find a place for themselves. To what extent they will be able to draw upon the new cultural and ethnic assertions of identity awakening around them as they face such a future remains to be seen. What stances and attitudes the purveyors of power in the new corporate capitalist order adopt towards the new assertions at and from the grass roots is not yet clear. Their strategies of integrating the whole world into their model of world governance are still taking shape; their 'data base' is not yet clear; they have a wide variety of advisors ranging from hard-nosed technocrats to both tactical and believing democrats. Will the theoreticians of a 'democratic world order' be able to enable the forces from below to make their

voices felt or will they instead prefer to 'educate' them to make them amenable for getting integrated into a global 'free market'?

Much will depend on the new generation's ability to handle both the new thinking from the globalised structure of trade and technology (and its local representatives in business and government), and the demands and pressures emanating from a variety of rebounds from the past that are on the upswing as a result of fundamentalist reactions to new vacuums in the power dimension of the world. What kind of a new model of 'secularism' will they be able to fashion for dealing with these twin challenges also remains to be seen. In India the attempt to build a distinctively Indian model of secularism based on plural identities on the one hand, and the claims of deprived and dispossessed minorities – both religious and social – and their anchorage in diverse community cultures and lifestyles on the other, seems to have suffered a setback, largely as a result of the failure of the state to safeguard such a model of secularism. The current confusion arising from secular leaders masquerading as religious beings and religious leaders hobnobbing with secular politics has pushed Indian pluralism into aggressive channels. Meanwhile the new consciousness of globalisation in which we find ourselves engulfed is one in which cultural self-confidence is on the decline while false consciousness based on chauvinist 'nationalist' drives seems to be on the ascendancy. While there are undoubtedly new and reassuring assertions of the human spirit (as was powerfully shown during the literary and artistic response to December 6, 1992 in Delhi and elsewhere) even while national elites are at a loss to understand and grasp the meaning of these assertions, there is no clear agenda of cultural revival and political restructuring that one is able to perceive, much less predict.

ERA OF CHANGE BUT DEEP AMBIVALENCE

A number of other indicators of this ambivalent state of affairs can be identified, particularly in the local and national terrains of the emerging human condition.

(1) There is taking place an increasingly less and less open and tolerant attitude to forces of dissent and non-conformism indicating a real shift in elite perceptions and attitudes as against those found among the 'illiterate masses'.

(2) Among the oppositional forces, the intelligentsia and 'grassroots' activists, there is a growing decline in confidence, organisational capacity and motivation for challenging the status quo, a decline in ideological élan for taking on the system or even the ruling establishment, and an increasingly defensive orientation, of late becoming reactive and adopting negativist and nervous (noisy) stances rather than asserting new visions and strategies.

(3) One is witness to a growing fragility and uncertainty in the overall intellectual and political response to the happenings of the day, to the twists and turns of history—both in the world at large and within the terrains of the state and civil society.

(4) Socially, there is a growing alienation and fragmentation and sharpening polarisation between classes and communities as the social base of the polity has narrowed instead of being progressively widened, and as the fight against poverty has moved from being perceived as an economic task to be carried out by government and planning bodies to being seen as a struggle against local atrocities and vulnerabilities. Poverty and unemployment are seen as a consequence not so much of misfortune and relative deprivation as of the withdrawal of rights by the system, of legal and institutional entitlements.

(5) Also, much more than before, the social condition has become dependent on access to, or exclusion from, natural resources, land entitlements and the relationship with village commons. At the same time, accentuating class conflicts and growing pauperisation caused by alienation from land, water resources and ancestral rights over forests, and growing pressure for sheer survival, are producing hostility from the very classes that had for so long felt drawn towards nature and the 'environment' (especially the tribal populations² and the rural poor).

(6) As class/caste conflicts and alienation from land and natural resources have been reinforced by declining economic returns from productive forces for large sections of the agrarian social structure, both segregation and stigmatisation of dalits and other lower classes have grown. Side by side with this the push towards urban conglomerates on the part of the land-denuded OBCs and dalits has raised the pressure for government jobs and the demand for a new genre of 'rights'—especially the right to work—and as part thereof special rights for the hitherto discriminated against social strata through reservations and the like. To all of this the upper class bureaucracy and the middle class parents of the new generation of students in

the universities, already uncomfortable with things like Mandal and the upward mobility of various minorities including the dalits and the political challenge posed by them, are reacting violently. (Hence the growing anger with men like V P Singh.) This growing incapacity to accommodate economic grievances and political aspirations has in turn produced a backlash not from the oppressed social strata but from the economically left-behind sections of the twice born. The result has been the Mandal-Mandir explosion (which is still not over), joined on the one hand by the Hindutva brigade (extending from Hindu communal parties to university academics) and on the other hand by the stirred consciousness of the dalits and the minorities.

Deep convulsions lie in store for civil society as it proves unable to open up the machinery of the state for providing new avenues of opportunities and power for diverse segments of the poor from all castes and communities. It is because of this closure to the new aspiring entrants that a whole variety of forms of ethnicity (autonomy-seeking, separatist, based on claims of self-determination or recognition as 'indigenous peoples', or simple inclusion of ever new claimants in the reserved category for jobs and opportunities)³ has been on the upswing. The emergent class-ethnic-caste mix has been, for long now, waiting for a response from the elite classes. Yet the only response coming from the latter has been to so modernise society that a select 'middle class' gets created, the licence-permitraj is opened up to global corporate enterprises, and the state itself, not just the private sector, gets integrated into the world market.

(7) Meanwhile, traditional avenues of mobility towards and into the modern sector, through raising thresholds of personal worth, quality and dignity within a complex social terrain are getting short shrift. The package of education, health, shelter, sanitary conditions and various social minima in terms of guaranteed prices of necessities like food and clothing—together producing rising degrees of social empowerment through which alone, it is now clear, states of poverty, unemployment and disparity could be reduced—is being systematically downplayed and downgraded. There has taken place a whittling down of social policy, *ipso facto* producing gaps between the privileged and the oppressed, so much so that any design to merely raise the aggregate growth rate of the GNP, even if this be combined with distributive packages and plan schemes and even if the demands for self-determination and autonomy at local levels be conceded, is not likely to reduce or even contain the growing social divide. With this, the whole economic model and indeed the enterprise of the state is likely to get delegitimised and lose credibility.

(8) Looking outside the country for remedies is the surest way of putting a freeze on a turbulent social order, which will not stay put in a frozen state for long but only ignite forth into a boiling conundrum which a state on horseback will find impossible to hold. If we have been able to hold so far, somehow, it has only been through a growing dispensation of coercion, brutal control over the social order, and a combination of cleverness, chicanery, cunning, craftiness and cynicism in relation to the people. We have encouraged high degrees of demeaning corruption, criminalisation, and deliberately encouraged communal sentiments among large cross-sections of individuals and professionals, who have each and all been isolated, rendered impotent and made subservient to a competitive social ethic that we are being asked to imbibe for integrating with a style and structure of governance called the 'new world order'. But how long can such a cynically contrived structure of governance itself survive the gathering thrust of social and political pressure from all sides in so many states, even if the latter are willing to sacrifice their legitimacy and 'sovereignty'?

(9) The model of marginalisation, exclusion and dispensability of the weak and the poor that has emerged out of such a ethic of the survival of the fittest that seems to be taking charge of the minds of national elites (here and elsewhere⁴) is not simply an expression of upper class racism *vis-a-vis* the lower classes. Nor is it just (as is often argued) a result of the incapacity of the state to carry the 'burden' of a growing population and growing hordes of the poor and the 'irrational' social strata who will not somehow get easily modernised. It is rather at bottom a reflection of the failure of the politico-constitutional system, its very stability and effectiveness, its capacity to make economic development an engine of social transformation. (For long the assumption was that economic logic was autonomous of social and political constraints, an assumption that has cost the country dearly.⁵) It is also a reflection of increasing erosion of confidence in the elite's own ideological construct in which it had once put so much faith. The result is that the 'dispensability' that finally emerged was not just of millions that could not be accommodated in the industrial and economic superstructure, but also a dispensability of institutions through which alone the economic, the social, the political and the ideological dimensions could have been held together and enabled to hold the country together. Once the institutions became dispensable, the elite was forced to operate in a vacuum producing in its wake the growing appeals of communalism, sectarianism of various types, religious and cultural fundamentalism and, capping it all, a new virus of national chauvinism (loosely integrated into the 'new world order').

It is this interface between a globalising corporate economy and 'world order' engulfing major regions and states, and further accentuation of national chauvinism within and between the same – seemingly contradictory but in fact converging – that provides the new setting of the 'nation state'. The latter is at once under siege and trying to hide this fact by a bravado of anti-western (mainly anti-American) reactions, while at the same time permitting multiple backlashes and counter-thrusts: a globally homogenising culture, communications and consumerism on the one hand, and regionalist, sub-nationalist, ethnic and 'communal' assertions of identity – often employing instruments of violence which in turn invite increasing thresholds of anti-insurgency terror mounted by military and intelligence layouts – on the other. The nation state is caught in between this pincer of developments, all of them de-nationalising and de-institutionalising, producing deep vacuums all over the place and the rise of uprooted and adventurist 'leaders' and their criminalised and corrupt agents.

Together, it is all highly destabilising, despite and perhaps because of the integrationist claims of globalisation, free trade and the removal of barriers to a free flow of goods and services across nations. The reality of course is that agreements like the one signed at Marrakesh hide a great deal of inequity between nations and peoples, both due to the sheer size of operations of the TNCs and their capacity to control the flow of technology and information, and due to several mechanisms like transfer pricing resulting in a drainage of wealth and resources from the south to the north.⁸ It has also resulted from insistence on the host countries lowering tax rates, hiking prices, depriving the working class of employment and the farmers of their rightful share in the produce of nature by dictating internationally fixed prices and terms of trade.

A great deal of globalisation is in fact – like 'national integration' espoused by centralised regimes *vis-a-vis* diverse cultures and peripheries – based on continuous fragmentation and erosion of existing structures and identities. And yet, on the other side of the new interface, there are loud voices being raised by political leaders, the media and the intellectuals against interference from abroad when it comes to the protection of basic human rights, of the bargaining capacity of the working class and the aggressive destruction of natural resources in the wake of globally inspired development schemes and technologies. In reality, of course, it is not the regimes in the south that are of their own accord turning against international norms of a humanitarian kind, and branding them as interference from the north, for in fact the actual wielders

of power and influence in and from the north, namely, the TNCs, prompt precisely what these undemocratic regimes are doing – violations of human rights, holding wages down and depriving the traditional social strata of their access to natural resources by hijacking the latter for export-oriented industrialisation.⁹

INSTITUTIONAL CRISIS

Returning to the issue of erosion and short-circuiting (leading in the end to 'dispensability') of institutions, I would like to move to the next step in the argument, namely, the most serious snapping of structural linkages in the whole national enterprise, that between the state and civil society. There has been a great deal of writing on the erosion of institutions in India following the rise of authoritarianism and personalised politics by people like Atul Kohli and Lloyd and Susanne Rudolph, who have dwelt at length on the concept of "deinstitutionalisation".¹⁰ To an extent I go along with their analysis, for there is no doubt that following Indira Gandhi's populist politics (and, I would add, Rajiv's attempt to substitute politics by technology) the real strength of the Indian political system, namely, its wide-ranging span of institutional functioning within which individuals and groups played their roles at so many levels, has been deeply eroded.

And yet I feel that "deinstitutionalisation" does not explain the reasons for such erosion: it only describes it. To my mind it has to do with the rapidly changing social base of the political process leading to a radically changed set of demands and conflict situations which the Indian state has been increasingly unable, and the Indian elite classes have been increasingly unwilling, to handle. Mere emphasis on decline of 'governance' and 'governability' only limits us to an analysis of a dysfunctional elite system. It does not go deep enough into the fact that such dysfunctioning is a result of a growing lack of fit between governing institutions and social demands. I have argued elsewhere at some length that a polity based on a well thought out social policy, a polity that is socially representative or even sensitive, would be in a better position to 'govern', allow increasing levels of interaction and communication between the state and civil society, and lead to rising levels of people's participation and their own involvement at different levels in the running of the state. Having long held that perhaps the crux of the Indian crisis over the last more than 15 years has been institutional,¹¹ let me also say that institutions are not ends in themselves but are mechanisms to keep both a system and a political culture ticking along, in the process satisfy a larger and larger set of constituents and publics, and at the same time respond to changing demands, agendas and perspectives. Institutions are a means to an end, to

a sense of the whole, to an idea of the direction to which a system is moving, to a vision. If the latter are forgotten, the value and legitimacy and indeed the relevance of institutions are bound to decline.

Of course, no political system can function effectively without pulsating institutions, particularly in the modern age, with the growing diffusion of ideas, aspirations and desires. A merely decentralised and multicentred structure cannot hold without being woven together through institutional channels. We need not be as obsessed with the issue of governance and governability as are the Americans, but we must always continue to come back to the challenge of institutionalising a democratic polity. The basic challenge – it arose after the 'garibi hatao' call by the new Congress leadership under Indira Gandhi in the early 1970s and again following V P Singh's call for Mandalisation and social justice – lies in responding to the upsurge of consciousness at the grass roots through a new and relevant structure of institutions, which do not hang loose over the landscape of peoples and communities but become instruments of their hopes and aspirations. It is a challenge that will not be easy to handle but without which, I have no doubt, this turbulent polity and civil society will not be able to hold.

PARADOXES OF GOVERNANCE

Let me try and bring together the import of the analysis presented so far in the form of three paradoxes facing India at the present juncture. First, we have a ruling class that seems to be at odds with the very institutions it had (or its forebears had) once created. It is a ruling class that seems pitched against not only larger and larger segments in civil society but also against elements in the very constitution of the Indian state – the judiciary, parts of the parliament and party system, sections of the bureaucracy itself, and of course the emergent leaders and organised interests from the grass roots. Second, though facing multiple changes and challenges, there is an increasing obsession with stability and survival, with somehow carrying on, holding to the chair as an end in itself, for this purpose manipulating the media and the intelligentsia through various exercises in public relations, continuously stepping back from the transformative thrust of contemporary history, at best turning the latter into populist jargon, in the process equating personal survival with the survival of the nation.

Countering such an obsession with stability and survival is only possible through people's organisations and a horizontal and vertical structuring of the same by individuals and groups outside the parliamentary and party frameworks who enjoy credibility and are seen as somehow representing the voices that are emerging, seen as conscience-keepers of the country. Over time the num-

ber of such individuals and variety of such groups have been on the decline. The basic paradox is that the very agents of change – from the state to the 'movements' (increasingly dominated by NGOs) – are fighting their own respective battles of survival.¹¹

Third, there is the whole centralisation-decentralisation issue, one of the most difficult in a modern liberal democracy. For, mere devolution of power and privileges to new sets of individuals and groups at local levels but still within the confines of the liberal democratic state will not empower either the people or the organisations and communities and regions to which they belong, not to speak of the communal and casteist tendencies to which they may be subjected by the local mafias. The challenge is how to create a mass society that is organised along a truly federal and democratic (decentralised) structure and does not degenerate into a disembodied, diffuse and faceless crowd. Let this not be the fate of the proposed 'gaon sabhas' in the 'panchayati raj' set-up that is on the anvil. Serious questions as to the relative merits of representative versus direct democracy continue to beset us. They are ancient questions being posed in the context of new mass societies.¹²

REVIVAL OF TRADITIONALISM

Beyond the crisis of institutions and other indicators of erosion and uncertainty, and in many ways reinforcing the basic paradoxes of governance, are new confrontations arising from the bottom grassroots of civil society of both a negative and a positive kind. There is on the one hand the confrontations arising out of the use of religion as a basis for politics – which at one level appears as a battle for ascendancy between the secular and anti-secular political parties, but which at another level unravels the more basic conflict between modern and traditional, outward-looking and nativist, trends in current politics. There is on the other hand the social confrontations arising out of Mandalisation, the growing upsurge of the dalits, and the emerging consciousness among the minorities, all of them challenging the power of new-brand traditionalists who seem to have turned their backs on the rich diversity of Indian society. Unfortunately, the appeal of, and often indirect support for, traditionalist and nativist thinking have come from sources that go beyond the typical arena of communal politics, many of them seemingly innovative and in parts seeking alternatives to the existing order (both national and global), and for this purpose drawing on multiple sources of experience, knowledge and wisdom, including of course indigenous traditions and theories about them (in opposition to the modernist stream of thinking and values).

To these newer expressions of traditionalism we shall presently come. Right now we note an overall atmosphere of drift and confusion, born out of uncertainty about the future and declining concern about the same, deep ambivalence arising out of too many changes leading to no real change. Conceptually too there is a great deal of ambivalence spurred by a new model of double-speak. 'Liberalisation' is not to be a goal to be achieved but a game to be played out to permanently subjugate both the autonomy of the state and the autonomy of civil society. Religion is not to be an exercise in further cementing a unique 'spiritual' inheritance of plural identities and social spaces but a see-saw between two contending right wing parties. Meanwhile unemployment on the one hand and communal violence on the other are undermining the survival capabilities of diverse communities and cultures. For the latter the scenario of uncertainty becomes a scenario of exclusion and dispensability.

Alongside this combined impact of institutional erosion, the philosophy of liberalisation and the communal backlash, are taking place still deeper erosions that are affecting national confidence and creating new doubts in the national psyche. Among these are:

(1) Side-stepping a wide array of social reform movements, the emergence of new nationalist intellectualism and anti-west rhetoric, often reflecting a deeply ingrained sense of inferiority *vis-a-vis* the west, *vis-a-vis* the modern sector and *vis-a-vis* the neo-western Nehruvian model of nation-building, in the process drawing on a whole repertoire of historic memories and nativist yearnings and rejecting almost the whole of the post-independence effort at creating a modern, secular, polity.

(2) Weakening of the liberal tradition for defending civil rights of diverse collectivities, buckling under when faced by aggressive drives of a monolithic collective, *a la* Hindutva, *a la* globalisation.

(3) Weakening of the composite nation-building model that had appeared at one time to be unique to India within the third world.

(4) Erosion of genuine pluralism that had cut across both tradition and modernity and provided a bridge between Indian culture and modern democratic politics. Slow and subtle but clear hijacking of other major streams too – Gandhian, Swadeshi, Bharat versus India, certain brands of indigenous creativity of both intellectual and aesthetic varieties (patriotic science, etc), paradoxically even strains of culture and arts and music and the performing arts that were supposed to be composite but have over time been patronised by insecure bureaucrats and politicians. Many of the anti-Congressite strains have taken forms that have unwittingly played into the hands of such nativist reaction to the modern secular perspective.

We face a serious dilemma here. Waging a struggle against the colonial state, the bureaucracy and the globalist version of imperialism is absolutely necessary if we are to realise our own character and worth and authenticity. And yet, lacking a truly historic and philosophical perspective relevant to the new Indian striving (in step with similar strivings elsewhere in the third world), this very struggle can prove so negativistic, ahistorical and uncritical towards Indian tradition, and the inequities and injustices inherent in it, that the result can turn out to be atavist and fundamentalist and land up in the Hindutva camp. On the other hand, the Nehruvite vision, lacking as it did a radical restructuring of civil society, ended up making us servile *vis-a-vis* external onslaughts, the net result of which is to be seen in the rise of Manmohan Singh on the Indian political scene and all that this represents, leading to an erosion of one's pride in being Indian, erosion of self-reliance and of India's role in creating a composite third world identity, of the long-felt urge for providing an alternative to western lifestyles, technocracy and consumerism. We need to remember that every discourse on tradition – be it the one rooted in an uncritical recapturing of the past or the one seeking to take us to an abstracted future – becomes repressive. Our aim has to be social emancipation, distilling it from a struggle against both traditionalism and modernity.

NEHRUVIAN MODEL ON DEFENSIVE

We have run into deep waters following the combat-style confrontation between the Nehruvites and nativists. The problem is at one level philosophical. The much touted controversy between the universalistic faith of the 'scientific temper' school, for whom there is no difference between the knowledge system of the west and of India as both are to be based on a common paradigm of science and technology, and the alternative sciences school for whom there is something unique – and almost superior – in 'indigenous' science, seems to have run into a sterile and rather repetitive rhetoric, both sides having failed to produce a creative civilisational discourse. The possibility of a fruitful dialogue between the two has receded further with mutual imageries getting reinforced, with the former falling into a trap of servility *vis-a-vis* global corporate capitalism (including of the 'radicals' and 'nationalists' among them), while the latter getting more of a sympathetic response from western critics of their own materialism and technocracy and consumerism (together called 'maldevelopment') than from their own peoples.¹³ Here perhaps lies the great difference between the latter and Gandhi who they tirelessly keep projecting as their model. Gandhi was a iconoclast *par excellence* and was attempting to simultaneously cleanse tradition of its both innate and

accumulated oppressions and struggle against the servility inherent in any blind adoption of modernity – and both as part of a political movement for social transformation. Today's exponents of indigenous alternatives are at once apolitical and unprepared to wage struggle against the evils inherited from the past.¹⁴

Both the statist-modernist elite and the indigenous strands opposed to it share, paradoxical though this may sound, a nationalist, anti-western and at bottom reactive stance. Both tend to reinforce conservative streams in antecedent social structures and mores – in some ways the indigenous, traditionalist strands more than the state jingoist, national-chauvinistic ones, though at bottom the latter pose a greater danger of emerging with an official doctrine of an authoritarian, fascist mould, utilising all the wherewithal of state power in their drive, while the indigenous strands do this only by providing a lease of life to both dormant and receding spaces in a defeated culture. At some points the two could well converge.¹⁵

My own preference is for an at once robust and self-confident and democratically sensitive model of 'nation building' in which the institutions of secular democracy are conceived as (and where they slip and become oppressive, transformed to become) instruments of liberation from both the atrocities of traditional structures and the oppressions of the modern state and polity. The inherent repression of the state as a coercive apparatus has to be fought against, but the historical-cum-philosophical conception of the 'nation state' as a catalyst of national self-realisation and resurgence, and for containing both the intrusion of exogenous forces of hegemony and control and the periodic onslaughts of local structures of oppression, ought never to be lost sight of. A democratic ethos sustained and safeguarded through the autonomy of the state which is able to keep both these intrusions and onslaughts at bay is what is involved in this conception of nation-building. As of now perhaps the most crucial test that it faces is with respect to the growth of religious and cultural nationalism of the majoritarian variety, grown out of a hurt sense of pride and a feeling that the modern state and secularism have left the Hindus out on a limb. Picking up from the defensive assertiveness of revivalist strands in the 19th and the early 20th centuries, this particular brand of nationalism is finding a series of new constituencies among academics, activists and journalists, several anti-western and anti-modern streams found in the so-called 'new social movements' (paradoxically most vividly pronounced in international seminars and conferences), and the new nativist movements of traditional 'patriotic' science, swadeshi and other slogans, most of them inspired by the 'India vs Bharat' call of Sharad Joshi and others.

I would rather that while we can and must fight the imperial drive of modernity we must beware falling prey to the pulls of all kinds of traditionalists (most of them, like Sharad Joshi, upper caste, anti-state and pro-liberalisation) or some false romanticism of already fast receding pasts. There is need instead for a confident rebuilding of one's own nation, state and civilisation and imbibing them all with a distinctive model of humanism that is based on the persisting Indian penchant for pluralism in the social terrain, compassion for the poor and the long suffering social strata, and the drawing together of diverse minorities into one composite though not monolithic culture. In consonance with that composite perspective, there will also be need for identity and a sense of common striving with worldwide struggles for equity and a humane world order.

Many other well-motivated and highly committed but at bottom ahistorical and apolitical 'movements' fail to contribute to such a process of re-building and transforming the nation state. 'Azadi Bachao Andolan', a variety of neo-Gandhian 'vikalpa' conventions, many new versions of *Hind Swaraj* but lacking Gandhi's political momentum, and some though not all offshoots of the anti-Congress legacy of Lohia. Similarly, the idea of a 'Second Independence Struggle' ('Dusri Azadi') sounds to me too romantic and single-stroke an idea, even with a mind-set that is at bottom ahistorical. Instead of taking the Indian enterprise further, it is simply rejecting it and wanting to start anew. It involves a polarisation of time along with polarisation of ideology, as if all 47 years since independence have been wasted. While there may be a lot of intellectual bravado in it, it is highly irresponsible, ignoring as it does the struggles and yearnings and hopes of millions of people across so many generations, of those who toiled to give us an India to belong to and on that basis of belonging, to transform it.

This is not to support or uphold the Nehruvian legacy. It was too much of a carbon copy of the west to succeed (despite some efforts by Nehru himself to 'synthesise' India's cultural heritage and modern institutions and usages).¹⁶ Even at that it failed to sustain the considerable framework of overall vision, institutions, ideological perspective and political culture that had once been held out with a view to transforming Indian reality for carrying forth the social revolution for which it was in a way intended. It was this promise of the new Indian enterprise which led the people to lend it their support for so long, make them willing to undergo sacrifices and put up with injustices and exploitation, and for which they had even tolerated the leadership's lame excuses and hollow explanations and brandishments (ala Narasimha Rao). It was its failure to carry through the social revolu-

tion (however modestly conceived it was) – remove poverty, reduce injustices, expand the spaces for diverse peoples and communities – that has led to so much discontent and has produced an institutional vacuum which has played into the hands of obscurantist and neo-fascist forces on the one hand, and the globalising thrust towards undermining national autonomy and independence on the other. Meanwhile there has taken place a widespread impression of a state that has gone astray and a society that has lost its moorings, while the 'system' that was supposed to have delivered the goods is losing its capacity to honestly lay out what is to come next and prepare the people for the same, producing a veritable no man's land, giving in to either despair or sheer cynicism (though some may still feel excited that everything is at last changing).

And yet this was one system that was a stable and going concern, with some basic commitments and allegiance to values, even if a little inchoate and ambivalent, the ideological stance that was adopted being not sharp enough; perhaps in that lay the strength of the model, provided of course the key leadership knew how to steer the ship of state. That the stability that it promised generated complacency and a degree of inertia was also to be expected; all functioning systems tend to stagnate. But this of itself may not have mattered too much so long as the basic institutional framework was intact and working, and had a minimum of accountability and tolerance of dissent and its legitimacy.¹⁷

The basic failure of course was not to have indigenised the Nehru model. Even this would have happened, not through some dogmatic or fundamentalist rejection of all external influences – modern technology, western ideas of either liberal or socialist vintage, the English language – as by simply carrying through the agenda of social transformation, making it the essence of the secular drive against parochial interests of both traditional and modern kinds, thus moving closer to the people and enabling them to come into their own, in that way almost automatically indigenising the model. It is now clear that vested interests in both urban-industrial and rural agricultural sectors succeeded in defeating the social agenda that had emerged out of the composite 'Gandhi-Nehru' legacy, and creating growing discontent at the level of people's responses and attitudes (after they had given the model a long try) and a yawning vacuum at the level of institutions and the value system. (The Nehruvian model of the state failed to build effective defences against these interests.)¹⁸

It is the attempt of Hindutva to mobilise this discontent and fill this vacuum by an appeal based on sectarian and dogmatic lines. It cannot succeed because it too lacks a social agenda. I have no doubt that the future lies in the Mandalite direction (I use the term

symbolically rather than descriptively) through a coalition of ground level forces drawing upon major sections of the dalits, the Muslims and other minorities and the lower rungs of the backwards and the landless and resources-depleted peasantry (cutting across caste identities). That this is a direction that strikes terror and insecurity among the professional middle classes, the intelligentsia and the mass media is, of course, true. But fortunately the values and commitments of democracy are still vibrant. Liberalism is not all dead and there is a genuine fear of Hindutva. Which way this polarisation between top-down resurgence of nativism and the bottom-up resurgence – not so much of nativism but of diverse representations of indigenous reality – will get resolved, is not yet clear. Perhaps it will all remain polarised for a long time until a new structure of leadership and social cadres emerges from the failures and ruins of the present one, stirred out of the very tension and violence that is on the upswing, some of it reflecting a new determination among sections of the masses to fend for themselves and, through their own strivings, find a path, a perspective and an intellectual vision suited to their aspirations.¹⁹

EMERGING CHALLENGE: NEW IDEOLOGY?

Perhaps the greatest challenge that the political process of producing such a vision, and the institutions and policies based on it, will face will be with respect to the global threat of the only prevailing ideology of social change and 'reform' that seems to be gaining ground among so many, namely liberalisation based on delegitimisation of the state, privatisation of the means of production, and globalisation of finance, trade and technology through the enormous concentration of economic power and the global reach of the TNCs, the philosophy of 'market' being the *sine qua non* of it all. It is an ideology (if it can be called that) that exudes great confidence and expects to conquer the world by making full use of the global framework of institutions that were originally established to deal with disparities between states (carrying forward the Keynesian ideas of public policy), but have since become the exponents of the ideology of the market.²⁰ Together, the TNCs and the Bretton Woods institutions have been at work to disempower both the nation state and the diverse cultural and civilisational thrusts of non-western civil societies, as well as the cultural and class (and caste) expressions of the newly mobile and aspiring masses.

Fortunately, there is an inherent instability in this new enterprise of globalisation as literally billions of people and thousands of communities and cultures are left out of its purview. It is also at bottom highly dehumanising and brutalising. Can liberalisation liberate the top soil lifters and demeaning lifestyle of the 'bhanga'? Does Manmohan

Singh or Narasimha Rao for that matter, or the many minions working for them, know anything about the basic condition in which millions in India live? What kind of 'reform package' is this 'liberalisation' if it not just fails to 'liberate' the poor and the destitute but in fact wraps them around in circles and chains of permanent bondage?

Liberalisation is being advocated both as an alternative to the earlier model of development and as one to which in fact "there is no alternative" (the well-known TINA hypothesis). Civilisationally, Indians find such ultra-confidence shown on behalf of any new idea or ideology difficult to swallow. They are by now tired and somewhat exhausted with each new display of 'alternative' programme and party and paradigm. They were let down by the Nehruvite promise and have since been let down by many others. But as one has to somehow keep going, one comes out with either a ton of bricks or a kilo of flowers and a lot of clapping, usually the latter. It is still (despite growing disbelief) a civilisation in which word matters more than deed, so much belief that once a thing is said, it will be done, so little demand for real and decisive action.²¹ This may well turn out to be the case with liberalisation on which there is a lot of criticism but no real dissent. On the whole the rhetoric seems to have stuck, above all on those in charge of the mass media. The pity is that so many people seem to have pinned their hopes on the rhetoric, laying out their hard-earned savings – and beliefs – at the altar of these announcements, the urbanites more than the rural people, some of whom even write lengthy articles and books expressing either excitement or their sense of let-down as has happened following the compromises and concessions made by the liberalisers. In the meanwhile, though, in the name of 'liberalisation' the liberties of so many millions have got eroded and brutalised. Also, in the meanwhile, the state has been rendered impotent and made incapable of responding to the demands and urges of the people.

The challenge before the new emerging coalition of grass roots leaders will be to lay bare the deceit and double-speak underlying the whole new model. This will not be easy as, lacking a well worked out alternative ideological perspective following the growing irrelevance of the current models (liberal democratic, Marxist, Gandhian and that underlying the new social movements),²² the new promise held out by the 'ideology' of liberalisation is likely to take in sections of the newly resurgent peoples and communities (e.g. the dalits, the backwards, the minorities, above all the supposedly resurgent women) who all seek enhancement in status and a greater share in the power structure of the state and civil society but who, given that motivation, may feel tempted by the new promise, the way it is being presented.

The dalits, for instance, are far more concerned with seeking justice at home (in terms of a more egalitarian social order and positions and power in governing structures) than in fighting world imperialism. They have also been for too long humiliated and exploited by a highly arrogant and corrupt administration. More or less the same applies to the Muslims, the backwards, the tribals and the women aspiring for gender justice. Their battles are to be waged here and now, in terms that are at bottom social, carried out in settings that are local (as against the NGOs and the intellectuals and activists of this or that 'new social movement' who get drawn into the seductive international vortex of conferences and rhetoric)²³

Their battles are global only by inference and as a result of the negative consequences of policies pursued by the national elites under the influence of transnational actors that affect their economic prospects (both jobs and livelihood in general). For this (as well as against so many ill effects of consumerism spurred by the TNCs) they need to join forces with global movements of protest and resistance, of course with their own agenda in mind, namely, a social struggle on behalf of the poor and the oppressed and the socially stigmatised everywhere. But all this is different from the usual dichotomy between globalising modernity and local and regional tradition, the latter is fast losing relevance for them. It is also losing relevance for large sections of the youth – women as well as men – and not just the 'yuppie' generation of middle class youth but even among the lower middle and the poorer strata.

BEYOND TRADITION AND MODERNITY

It is not that traditions are not relevant any more; if anything they have grown more relevant in light of the failure of the Nehruvian model of secular change when it comes to the needs of the socially oppressed. There is also so much ancient wisdom, knowledge and even time-tested technologies to preserve or build upon. Nor is it that elements within modernity have become any less important; again, if anything, some of them (especially the institutions of the modern state) have grown in importance, especially for the deprived and marginalised sections who want to get liberated from the hold of traditional institutions and the social system. Rather, what we have is a discovery that some traditions are proving weak and fragmented, too dispersed and ritualised, hence making those who at one time subscribed to them turn to new and more defined structures, towards institutions and mindsets that modernity provides. At the same time much of the promise of modernity is wearing out too.

Where does one turn? Rediscovery of the vitality of traditions and drawing upon their

innate wisdom and storehouses of knowledge and ideas can only take place if there is a shift from freezing of the *status quo ante* to transforming diverse traditions through restructuring them, redefining goals and reorienting lost creativity. Only thus can the new waves of disbelief and growing lack of faith in the institutions of the modern state be handled through a new interface of what used to at one time work but have fallen in disuse, the new structures that were brought in but have failed to realise their objectives, and the yet new futures that have to be built from the vacuum created by both these failures.

There seems to be a growing sense of betrayal and deep ambivalence among the oppressed with respect to modern institutions, which has often led to a falling back on their own reserves, but without necessarily turning to old and already discredited structures and loyalties. In turn, however, as we have already seen, the sense of betrayal has been used by obscurantist forces for their own ends. This simultaneous loss of faith in both the new model of development and social change and old, tradition-bound, beliefs and values and the growth of obscurantist and neo-fascist forces in place of both have generated new oscillations and sense of dissonance. This has happened not just in respect of prevailing political arrangements and the responses emanating from civil society, which is under stress and riven with deep conflicts, but also in the intellectual grasp of it all.

SCPTICISM ABOUT ASSUMPTIONS

Many other doubts are on the rise. Take the assumption of equality of nations, each sovereign, each like the other at least in legal status. This is fast giving place to a realisation that what we have is a hierarchy of states, a majority of them bound in diverse modes of dependence, with many forward-backward ('developed-developing') dichotomies, deeply laid disparities and dispossessions. Over time so many of them (more and more of them) are denied access to global institutions, legal frameworks and erstwhile agreements and conventions, in the meanwhile being pushed into new draft agreements (GATT, etc) to which so many nations – and classes – are being made hostage. This has produced both a growing sense of powerlessness and a new traditionalist reaction thereto in the form of a new upsurge of ethnicities, nationalisms, new self-definitions of identities, all of which are both questioning and challenging the old assumption of a world based on equal and sovereign nation states. The UN itself, which was originally proclaimed as consisting of sovereign and equal states but was in fact an elaborate camouflage of a basically highly unequal and disparate world, drawing away from rather than contributing to a common 'universal' cure, is at last being more openly

and bluntly turned into an instrument of unequal power relations. There are still some idealists who would like to make the UN a genuine instrument of the struggling peoples of the world and a set of values and objectives held dear to their hearts.²⁴ But it is a long struggle ahead. The point is: should one even strive to create an 'equal' world of 'sovereign' powers? Is it not a chimera? And is it desirable any way? Can a 'world civilisation' be based on mechanistic and linear notions like these? Was this not in fact the main flaw in the institutional project launched by modernity?

Or again take the growing doubts and new questions about basic concepts like equality and/or justice: what is to be preferred, a notion of justice based on mechanical equality and the competitive ethos inherent in it, or a more organic conception of justice arising out of an admission of the inherent plurality of the human situation? Or justice *vis-à-vis* human rights: which conception of human rights, legalistic and confined to some fundamental political rights, or a notion of human rights that goes into basic social and cultural relationships among humans and communities? Or take 'democracy': is it to be representative from bottom to top, which in fact becomes a top to bottom process, or is it to be based on a fundamentally federal and pluralistic view of democracy? Same with the concept of decentralisation of power: is it to be decentralisation of state power from the centre downwards or is it to be based on a widening role and scope of civil society and people's organisations and a correspondingly reduced role for both the state and the market? Not having dealt with these relatively simple questions of a definitional kind has led to a situation where the principle of social justice has been gradually replaced by that of structural adjustment, while the idea of social purpose to be pursued in diverse national settings is being given up in favour of global demands of a technological and financial kind. Overall, the entire model of democratic nation-building is being fast replaced by that of technological progress, underplaying the rights and demands of the people.

On globalism too, the humanist vision of the 'global' and 'planetary' kind is being replaced by the technocratic discourse of globalisation which has permeated the thinking on human affairs in one society after another. These societies had already committed themselves to the model of 'modernisation of traditional society' through things like high rates of growth of the economy, pursuit of industrialisation and other objectives of state-directed development. This too had its flaws and shortcomings and lacked a vision suited to plural societies like ours. But the modernisation that the discourse of globalisation has in mind is based on total capitulation to a homogeneous model that is globally conceived and seeks to put an

end to the plurality of diverse modernisations that were under way, many of whom had in-built ideas and values of a humanistic kind and often included perceptions and thinking drawn from indigenous reality. It is necessary to not just draw distinctions between modernity and tradition but also between types of modernity and modes of tradition, the total picture being one of a large diversity of various mixes of understanding and thinking. The model of modernisation based on a globalised market and a globalised ethic of consumerism will take us to a system in which every detail of choice and desire is processed – or so at least is the design – by a large single machine, society itself being conceived as *homo machina*. There is hardly any 'freedom' in this 'free market'.

Just as we need to distinguish between types of modernisation and models of development, there is also need to not think of concepts like poverty and exploitation in homogeneous terms. There are diverse forms of exploitation and many types of poverty; distinctive historical contexts of exploitation giving rise to distinctive types of poverty. We need to distinguish between (i) economic exploitation associated with the growth of urbanised industrialisation as was found in England and western Europe, following the enclosure movement and the highly unplanned urban-industrial growth based on large influxes of migrant labour from the countryside; (ii) creation of surplus value through primitive exploitation in agriculture as was undertaken in large parts of Europe and later in the Soviet Union, and (iii) both these processes combined with a nexus between feudalism and commerce as found later in the developing countries including the NICs. But all these need to be distinguished from (iv) exploitation under way in India and other countries in south Asia (not all of which was economic and took diverse forms); or (v) the later north-south exploitation through trade and technology and, of course, (vi) the latest neo-colonial phase of exploitation through trade regimes on the one hand and finance capital and debt on the other.

All these and other similar distinctions of a definitional and conceptual kind have become necessary given the present drift into a highly uncertain and ambivalent future at a time when, for other reasons too, the human agenda has got added to it a whole set of new issues such as gender equity, environmental justice, ethnic/cultural upsurges, new-style movements for federalism, decentralisation and self-determination, and above all, the slow but undoubted resurgence of the democratic ferment in civil society as an alternative to both the state and the market while at the same time countering the rise of phoney religiosity and the communal virus, together producing completely new demands on the political process. I have

not mentioned the growing struggles of tribals and the slow but definite awakening among the indigenous peoples, castigating the mainstream with the charge of liquidating their distinctive heritages, theologies and worldviews, all of this taking place precisely at a time when the salesmen of globalisation appear to be running amuck with its design of 'reforming' the world as a whole after a single image. The earlier points made on the rise of the dalits and the new kind of radical challenges it poses, in counter-distinction to both old and new social movements, can also be added to this list of issues and concerns that goes into the making of the new human agenda.

RETHINKING INTELLECTUAL/POLITICAL AGENDA

Much of the above discussion is meant to begin a process of rethinking, for moving beyond the crisis of ideology and institutions in which we presently find ourselves, also with a view to assist in the current search among the leaders of the oppressed strata of society for a relevant framework for their praxis. A few more issues may be added to what has already been said. First (something that is already implied in the foregoing analysis), we need to accord primacy to the social question. At the time of independence the elite was provided with two streams of thinking on the emergent historical process. There was the national-bourgeois stream based on the nation state as a unit of organisation of the world and economic development as the principal agenda facing it. There was, secondly, the socialist alternative based on a different model of stages of growth, namely, from feudalism to capitalism to socialism, all of which also was to be achieved through the instrumentality of the nation state and a world composed of nation states. In both of them the social question was left out. Since then, and particularly of late, the social question that has emerged on the horizon is based on an 'upsurge of identity' at various levels. It is still lacking in building a new definition of either development or progress or modernisation or just change. This task remains to be carried out.²⁵ Similarly, with respect to ideas of democracy, pluralism and the state we have so far limited them by focusing on a model of governance or at best a model of representation. Missing in them all has been an appropriate model of unity and integration as well as a critique of the kind of integration that has taken place which, as we have seen, has led to the phenomena of exclusion and dispensability. It has to be a model that goes beyond the so often repeated maxim of 'unity-in-diversity', which is of course basic but needs specific elaborations from the standpoint of the poor and the diverse strata of the oppressed.²⁶

Also missing has been a model of the relationship between the state and civil

society. A consequence of these missing links in the overall conceptual framework of development and democracy, and particularly as a result of the decline in interest in civil society over time, has been a rising spurt of revolt and restlessness, which has led to the belief that democratic praxis consists in struggle instead of 'building gradually' which was the basic assumption of the Nehruvian model of nation-building. In short, democracy becomes a 'demand side' of development as opposed to the 'supply side' that is involved in the Reaganite and post-Reaganite conceptions of development (now officially accepted in India as part of the liberalisation drive). In turn, the rise of the 'demand side' has produced a different kind of response from the system, namely, law-and-orderism. In short, we have two opposite models of integration, one based on supply side economics and law and orderism, and the other based on democratic theory and praxis as conceived by the people and people's organisations. Intermediate between the two are regional assertions, demands for autonomy and self-determination, and the efforts to translate the autonomy of the nation state into autonomy of people's organisations, of socio-political, cultural and artistic groups, of voluntary organisations and citizen bodies, of the media and of the whole information sector.

On the last of these there is need for major initiatives. There is gradually taking place a realisation that by their very nature mass media, particularly television, is immensely homogenising and undermining of diversities and autonomies, that the very cultivation of the habit of turning the idiot box on makes one a victim of monolithic and monopolistic tendencies. When one adds to this the increasing power of other types of control mechanisms under the auspices of the corporate sector, such as the power and reach of ad agencies, the growing spectre of official secrecy (more and more being utilised by the so-called free enterprise TNCs) and new forms of manipulation of the press, influential academics and other professionals, together producing a corrosive information order, one can get a more complete picture of the forces that lie behind the growing exclusion of millions from the centres of power and influence, giving rise to a rather sharp hardening of the interest structure of society. It is in this overall context that the whole striving for autonomy of the media – currently taking a back seat – needs to be perceived, and, based on the success of that striving, to relate the twin dimensions of the challenge of history, the expansion of freedom on the one hand and the mobilisation for change on the other.

Much of this is of course part of reasserting the fundamental axioms of democracy and socialism. Somehow the institutions to which the latter gave rise slipped away from realising the original objectives. There is

need to pick up the threads once again and join them to the new resurgence at the grass roots and the multiple stirrings of the human conscience that are already under way, and produce a new agenda for the human enterprise.

Notes

- 1 In what follows I have dealt with a number of emerging trends — globalisation, upsurges of consciousness and struggle from the grass roots, the deep ambivalence of ruling elites in respect especially of the role of the state, the erosion of institutions in the wake of both authoritarian tendencies and mounting democratic pressures, the overlap of all this with the raging conflict between modern secular and traditionalist forces, and the growing defensiveness of the Nehruvian vision and perspective against these sets of attacks. In developing the paper I have extensively on my earlier writings for which I plead guilty.
- 2 For a detailed treatment see the special double issue of *Lokavan Bulletin*, Volume 10 (5-6), March-June 1994.
- 3 On the whole debate over reservations see my 'Crisis of Representation', *The Hindu*, August 31, 1994.
- 4 On the dispensability thesis, see the chapter on 'On Humane Governance' in *State against Democracy*, Ajanta, 1988. On the emerging ethic of "survival of the fittest", see the chapters on the 'Political System and the Poor' and 'The Emerging Class Ethos' in my *Growing Amnesia: An Essay on Poverty and the Human Consciousness*, Viking (Penguin), 1993.
- 5 In the early decades (after independence) the mutual autonomy of the economic and the political realms may have been functional as I had once myself argued. See my 'Political Economy of Development' (R R Kale Memorial Lecture, 1971). With the quickening of the political process after the Emergency, however, to have persisted with the apolitical assumption of economic planning proved to be socially disastrous.
- 6 For a perceptive analysis of how the transnationals have turned the freedom of the free market into captive monopolies, see Aurobindo Ghose 'Transfer Pricing by MNC's: sinister Silence of Third World Regimes', *Economic News and Views*, Volume 1, No 11, May 1-15, 1994.
- 7 For exposure of both the uses made of the human rights issue by both western, especially U.S., diplomacy against third world regimes, and the equally opportunistic rebuttal of this by these regimes who continue to violate the human rights of their peoples, see my 'Human Rights Offensive: Damage Done by US Support', *The Times of India*, April 9, 1994. The same applies to the espousal of 'labour standards' by western regimes which involves better wages and living conditions and restraints on slave labour and certain forms of child labour as part of the new global trade regime, and the loud outcry of Indian and other governments of the south against the same, chastising it as new protectionist restrictions on trade and arguing for 'non-interference' in labour wages and rights of the working class and related 'social' matters. This came up both during the Uruguay Round of negotiations at Marrakesh and later in the H.O. at the 81st I.L.O. conference held in Geneva.
- 8 Atul Kohli, *Democracy and Discontent: India's Growing Crisis of Governability*, Cambridge University Press, New York, 1990.

- and Lloyd I and Susanne H Rudolph. In *Pursuit of Lakshmi: The Political Economy of the Indian State*, Orient Longman, Bombay, 1987.
- 9 The first somewhat detailed treatment of this was laid out in the chapter on social policy for the eighth plan when I was in the planning commission. The commission changed hands in 1991 after the fall of the National Front government and the final document of the eighth plan did not include it. I have republished it in my book *Growing Amnesia* op cit. I am thankful to Shekhar Singh, then adviser, planning commission for closely working with me in this effort. Since then I have written several articles on issues of social policy and their bearing on the whole question of the relationship between the state and civil society. The most recent of these was 'Flawed Democracies: A Critique of Indian and US Models', *The Times of India*, April 30, 1994. See also my 'Overview' chapter in Muchkund Dubey (ed), *The Social Situation in India*, prepared for the social summit conference to be held in Copenhagen in 1995.
 - 10 I had laid out the original institutional model as well as the beginnings of its erosion in my *Politics in India* (Orient Longman and Little Brown, 1970) itself. Although the book was written before the hovering clouds that led to the Emergency, the signs were clear. Subsequently, in a series of articles published in *Seminar* (1973 to 1993), I had gone into institutional erosion as the main reason for decline in democratic functioning, not just of the normal institutions of parliamentary democracy and the party system but the whole model of a federal, decentralised and pluralistic structure of both the state and its relationship to the social system. Many of these have been republished in my two volumes of *Politics and the People* (Ajanta, 1989). Later I moved to the institutional challenges of grass roots movements while in more recent years I have been concerned with the stirrings of civil society and their implications for the institutions of the state. For some time now I have held the view that the latter are bound to decay if they simply try to hold on and not respond to changing demands and pressures from below. See, especially, *State against Democracy*, op cit.
 - 11 The whole issue of the role of non-party political groups and movements (some of them known as NGOs in recent years) has been a matter of growing debate and controversy. For an early appreciation and theoretical formulation arising from a Lokayan-UNRISD workshop on non-party politics held in 1981, see the three articles by the present author, D L Seth, and Harsh Sethi in *Economic and Political Weekly*, Volume 19 (5-7), February 4, 11 and 18, 1984; Harsh Sethi and Smitu Kothari (eds), *The Non-Party Political Process: Uncertain Alternatives*, Lokayan/UNRISD, 1985; a strong critique by Prakash Karat at the very beginning of the discussion, 'Action Groups/Voluntary Organisations: A Factor in Imperialist Strategy', *Marxist*, No 2, April - June 1984; another major critique, especially of the Lokayan effort, by Gail Omvedt, *Reinventing Revolution: New Social Movements and the Socialist Tradition in India*, M.E.Sharpe, New York, 1993. For recent critiques and reconsiderations, see my 'Colonisation and Counter-Culture' in *Lokayan Bulletin*, Volume 9(1), January-February 1992 and the editorial to the most recent issue of the *Bulletin*, Volume 11(1), entitled 'Between Idealism and Pragmatism: Non-Party Formations and Political Parties'. See also Smitu Kothari's detailed treatment of the issue in the overall context of the role of social movements in a democratic polity, 'Social Movements and the Redefinition of Democracy' in Phillip Oldenberg (ed), *India Briefing*, Westview, Boulder (Colorado), 1993. For an earlier and somewhat comprehensive overview of the issues involved in the debate from the early 'voluntary agencies' approach to the NGO phenomenon, see my 'Voluntary Organisations in a Plural Society', lecture delivered as one of the Dr Mohan Sinha Mehta Memorial Lectures in Jaipur in 1985. It has since been published as part of P S Sundaram (ed), *The State in Crisis*, Somaya, Bombay, 1992.
 - 12 Related to the state of the debate on party and non-party politics is the evolving debate on decentralisation, its main thrust (as part of restructuring the state or reconceiving the relationship between the state and civil society?). Various governments, from the early thinking under Nehru following the Balwantrao Mehta committee report to the more recent legislations proposed under Rajiv Gandhi's, V P Singh's and Narasimha Rao's governments, ending in the 72nd and 73rd amendments to the Constitution. All this has happened alongside the commitment of all these governments to 'globalisation'. Scholarly and activist debate reflects both optimism and sceptical strands. My own thinking has moved from the highly positive 'Decentralisation, A Historic Necessity' in *Seminar*, June 1978 to the more recent 'A Perspective on Decentralisation', *Journal of Rural Development*, Vol 10(5), September 1991 in which I have moved away from a conception of decentralisation as devolution of power within the structure of governance to decentralisation as a shift from the centrality of the state (decentralised and all that) to the resurgence of civil society.
 - 13 For a critical assessment of the 'alternatives' intellectuals including rethinking of my own earlier positions on 'alternative development', see my 'The Yawning Vacuum: A World without Alternatives', *Economic and Political Weekly*, Volume 27(22), May 29, 1993 and *Alternatives*, Volume 18, 1993.
 - 14 Ibid and the earlier article on 'Colonialism and Counter-Culture' op cit. Also, 'The NGOs, the State and World Capitalism', *Lokayan Bulletin*, Volume 4(5), October 1986, since published in *State against Democracy*, Ajanta, 1988.

Rural Non-Agricultural Employment in Kerala

Inter-District Variations

Mridul Eapen

This paper focuses on changes between 1971 and 1991 in inter-district variations in rural non-agricultural employment in Kerala. The determinants of non-agricultural employment are examined through correlation analysis.

IN an earlier paper we had examined the nature and determinants of rural non-agricultural employment in Kerala, a state in which the process of diversification was initiated much earlier and is in some ways unique (Eapen 1994). The analysis was based on National Sample Survey (NSS) data for the state as a whole since the early 1970s, a period which marks a turning point in Kerala's economy. First, the process of commercialisation was intensified since the mid-1970s with an accelerated shift in area towards major cash crops such as coconut and rubber on account of sharp changes in relative prices *vis-a-vis* paddy. Second, there was an unprecedented outflow of workers, from rural areas also, primarily to west Asia (the 'Gulf boom') resulting in a large inflow of remittances. That the net result of these changes (despite a decline in paddy prices) appears to have been some improvement in rural well-being even among the lowest deciles of the rural population is reflected in the consumption data. We argued that the 'big push' for growth in non-agricultural activities since the 1970s appears to be consumer demand-based largely on the remittances. However, in the absence of a production structure geared to meet the emerging pattern of demand, despite a potential increase in productive capacity by way of savings generated largely from the remittances, most of the gains from such an accretion of incomes leaked out to other states. Kerala gained primarily from the increase in demand for services and a diversified food demand whose linkages, however, are few. Hence, though Kerala has a relatively much higher proportion of rural non-agricultural employment compared to all-India, the emerging occupational structure is weak, reflected in its inability to take advantage of the impetus for growth generated by the rapid increases in demand.

In this paper we focus on inter-district variations in non-agricultural employment in the state, relying entirely on census data. We discern some shift in the processes underlying rural diversification in the 1970s *vis-a-vis* the 1980s. The paper is broadly organised in two sections. In the first section we review the evidence, while in the second section we analyse the determinants of rural

non-agricultural employment through a correlation analysis.

EMPIRICAL EVIDENCE

Since a number of new districts were formed between the early 1970s and 1990s in Kerala,¹ adjusting for which would mean combining or jettisoning large tracts, we present the evidence for the three census years 1971, 1981 and 1991 for the districts as they existed in each of the years. This precludes an inter-temporal comparison of the districts whose boundaries have changed; however, since it is the pattern of employment in terms of ratios that we are primarily interested in, broad comparisons are not vitiated.

Table 1 provides data on the significance of non-agricultural employment across districts which have been arranged geographically: broadly, Cannanore, Wyanad, Kozhikode, Malappuram and Palghat constitute the northern region of the state; Trichur and Ernakulam fall in central Kerala and the rest in the southern region. As mentioned earlier, the census data are used for the inter-district analysis according to which the shift towards non-agricultural employment in the 1980s is not as sharp for males, as revealed by the NSS, but is sharper

for females. While male non-agricultural employment increased from about 39 per cent in 1971 to 43 per cent in 1981, in the following decade it recorded a marginal increase to 44 per cent. In 1991 almost the same proportion of male and female workers were engaged in non-agricultural activities – 44 per cent. It may be noted that the estimates relate to main workers alone (more comparable to the usual principal status [UPS] estimates of the NSS) since the industrial classification of marginal workers for 1991 is still not available.

The state average does conceal some inter-district variations: the share of non-agriculture in rural employment varies from 23 per cent in Idukki in 1991 to 57 per cent in Kozhikode and 56 per cent in Trichur (for males). Other districts where it is substantially higher than the state average for males are Ernakulam (52 per cent), Alleppey (49 per cent) and Malappuram (46 per cent). Wyanad and Idukki, primarily hilly areas (with a large tribal population in the former) have significantly lower shares of rural non-agricultural employment. As at the state level, the share of non-agricultural employment for males increased between 1971 and 1991 for almost all districts except Cannanore and Trivandrum. During 1981-91 when the increase in male non-

agricultural employment was marginal, districts like Trichur, Wyanad, Quilon and Mallappuram registered significant increases. Almost the same districts continue to occupy the top ranks in terms of the share of rural non-agricultural employment. In the case of Cannanore, while the share for males declined, in respect of females the share of non-agricultural employment in rural areas rose by over 11 per cent between 1981 and 1991. Female non-agricultural employment is much above the state average in Kozhikode, Kottayam, Alleppey, Quilon and Trivandrum while Palghat reveals a low and near constant share. However, since marginal workers form an important proportion of total female workers – 20 per cent in 1991 and 24 per cent in 1981 – and are largely concentrated in agriculture and related activities, their exclusion biases the estimates of non-agricultural employment upwards. Hence these numbers should be taken only as broad indicators of relative differences between districts

INDUSTRIAL COMPOSITION OF RURAL WORKFORCE

Table 2 gives the industrial distribution of the rural workforce. It is interesting to note that although the share of agriculture in rural employment declined for males in almost all districts, it was primarily on account of the cultivator category; the proportion of agricultural labour has remained almost constant as also of agriculture-related activities (disaggregated figures not given here). However, in Cannanore and Trivandrum there was an increase in the share of agricultural employment for males on account of agriculture-related activities in the former and agricultural labour in the latter.

Looking at the industrial composition of the rural non-agricultural workforce by districts, we find that for the state as a whole the tertiary sector accounts for almost 30 per cent of the rural male workforce while the share of the secondary sector is about 15 per

cent. This holds true for all districts, viz. a higher share for the tertiary sector. Between 1971-91 while the share of the secondary sector declined marginally for the state, major manufacturing centres such as Ernakulam and Trichur maintained their shares while in Kozhikode it recorded a significant increase. Alleppey and Quilon, the centres of major traditional industries of Kerala, viz. coir and cashew, also witnessed some increase in the share of the secondary sector. It is interesting to note that cross-classifying districts with high, medium and low levels of non-agricultural employment with high, medium and low shares in secondary and tertiary sectors [Basant et al 1994] we find a close correspondence with both, even closer for the secondary sector (Table 3). None of the districts with a high share of non-agricultural employment had a low share of either the secondary or tertiary sector. This is an important finding. At the state level we found that most of the growth in non-agricultural employment was in the

tertiary sector. However, at the district level it is observed that high levels of non-agricultural employment are associated with high levels of both the tertiary and secondary sectors.

Manufacturing, household and non-household, accounts for the larger share in the secondary sector. However, growth has by and large been significant in the construction sector, the share of which has risen for all the districts. The decline in the share of manufacturing was primarily on account of household manufacturing, while non-household manufacturing has maintained its share in relatively industrialised districts such as Trichur (13.4 per cent), Ernakulam (12.4 per cent), Quilon and Alleppey (9.2 per cent) and raised its share in some growing industrial areas such as Palghat and Kozhikode. In some districts the share has declined as in Trivandrum and Cannanore. Construction accounts for an above state average share in Ernakulam, Trichur, Kozhikode and Malappuram.

Within the tertiary sector, employment has grown in all the sub-sectors but it was the highest in trade and commerce, followed by transport and communication, the former now accounting for the highest share in rural non-agricultural employment except for Trivandrum, where the share of social, community and personal services is higher. The share of trade and commerce was the highest in Kozhikode, 17.5 per cent, followed by Trichur, 15.7 per cent. The share of social, community and personal services, which includes government service, education, health and personal services, does not vary much between districts, ranging between 10-12 per cent except for some of the newly formed districts.

Summing up from the above we observe that there are variations in district level shares of non-agricultural employment; however the coefficient of variation is low and has tended to decline over time. Even in respect of females for whom it was rather high in 1971, there was a decline. Almost all districts have recorded an increase in the share (to the extent that we can broadly compare districtwise figures over time) and the ranks of districts have not undergone substantial change. While the growth in the tertiary sector occurred across the districts and in each sub-sector, the share of the non-agricultural employment tends to vary positively with the shares of both the secondary and tertiary sectors. In the next section we focus on some of the major determinants of non-agricultural employment in the Kerala context.

DETERMINANTS OF RURAL NON-AGRICULTURAL EMPLOYMENT

In the state-level analysis we had broadly established that a high degree of commerci-

alisation, close rural-urban linkages, rapidly declining land-man ratios, increase in the proportion of marginal holdings, and growing levels of literacy, have historically played an important role in generating a high level of non-agricultural employment in rural Kerala. While these must have continued to impact on the rural employment situation, we had attempted to explain the changes observed in the 1970s and 1980s primarily in terms of the increase in rural prosperity, reflected in an increase in consumer demand for goods and services and investment demand for housing. The role of all these factors has been widely discussed in the literature; however, we emphasise the major contribution of the emergence of a fairly broad-based rural prosperity in generating a high level of non-agricultural employment in rural Kerala. This was based not on high levels of agricultural production/productivity but, as noted earlier, on a broad-based flow of remittances into rural areas and increases in agricultural incomes on account of relative price movements between food (primarily paddy) and non-food (primarily coconut and rubber) crops [Narayana 1990].

It is interesting to note that earlier studies which attempted to capture the impact of rural well-being through per capita expenditure levels in an inter-state analysis did not come up with significant results [Sankaranarayanan 1980; Unni 1989]. However, our analysis showed that there is a relationship between the increasing

and diversifying levels of per capita consumption in Kerala, even for the bottom deciles of the rural population, and the growth of non-agricultural employment in Kerala, particularly services. This could be, perhaps, due to the quantitative and qualitative difference which occurred in consumption levels since the late 1970s with the inflow of remittances, the sharp increase in relative prices of certain cash crops, and the growth in rural wage rates, particularly in non-agriculture which broadened the consumption base and its pattern [Eapen 1994].

To a large extent, then, the major hypotheses thrown up by studies on rural non-agricultural employment (RNFE) appear to hold good at the state level for Kerala. We have not discussed these at length since a number of earlier studies have done so [Vaidyanathan 1986; Unni 1989; Shukla 1991]. In this section we examine the role of these factors at the district level, focusing on the importance of rural well-being reflected in the demand for goods and services, as a major determinant. We shall also attempt to capture the changing relative importance of the underlying processes over time.

The exercise at best shall be an imperfect one since data at the district level in terms of rural prosperity is difficult to estimate. Per capita expenditure is not available, nor the remittances districtwise. We have attempted to capture rural well-being in terms of: (1) per capita state domestic

TABLE 3: DISTRICTS CROSS CLASSIFIED BY SHARE OF NON-AGRICULTURAL WORKERS (MALES) AND SHARES OF SECONDARY/TERTIARY SECTORS - 1991

product (SDP) in agriculture, that is, SDP in agriculture divided by the agriculture dependent population (proportion of cultivators and agricultural labourers multiplied by the rural population). We have not deflated the SDP primarily because we want to capture the impact of increase in agricultural incomes due to relative price movements between crops, that is, the terms of trade effect, very pertinent in the Kerala context. However it covers only a section of the rural population since the non-agriculture related population in Kerala is relatively high; (2) per capita bank deposits in rural areas districtwise (BKDEP); and (3) the incidence of migration in terms of the ratio of outmigrants to the total workforce, districtwise (MIG), both of which would broadly indicate the relative importance of remittances. Commercialisation is measured in the simplest way, viz, proportion of non-food crops to total gross cropped area (COMM).

Given the unique nature of rural-urban linkages in Kerala, we have attempted to capture it through (1) the proportion of medium towns to total towns (MT), and the proportion of small and medium towns to total towns (MST), and (2) the proportion of population in large villages (above 5,000 persons) to total rural population (PLV). While the process of urbanisation had been rather muted in Kerala, the decade 1981-91 witnessed a sharp increase in the proportion of urban population to 32 per cent which is now above the all-India average. Hence the degree of urbanisation is also included as a variable (URB).

Some of the 'push' factors out of agriculture have been approximated through (1) the rapidly declining land-man ratio defined as gross cropped area per agricultural worker, viz, cultivators and agricultural labourers (LMR); (2) proportion of marginal to total holdings (MHD) and the proportion of agricultural labourers in the rural workforce (ALF), since the proportion of non-agricultural employment is high among the marginal holders and the landless. LMR and MHD are of course interrelated, since

the lower the former the higher would be the proportion of marginal holdings; and (3) the level of literacy from the middle level onwards (EDM). This is also a 'pull' factor since education enables a shift from agriculture to non-agriculture. The compulsion to move out of agriculture due to decline in average size of holding through partitioning has played an important role which was brought out very significantly in a field survey we had undertaken. However, in the absence of secondary data to substantiate this phenomenon we are unable to capture its impact.

Tables 4 and 5 provide correlation matrices for male rural non-agricultural employment, at the district level for the years 1981 and 1991. It may be noted that data on some variables was not available for all years - for instance, proportion of migrants to total workforce in 1991, educated from middle level for 1991, and proportion of population in large villages for 1991.

It is interesting to note that in 1981 the incidence of migration (MTG) had a significant impact on rural non-agricultural employment; the role of bank deposits (BKDEP), though not significant at 1 per cent, is significant at the 5 per cent level. However there was no significant relationship between male non-agricultural employment and agricultural SDP per capita (SDP) or commercialisation (COMM), while urbanisation was significantly related.

Among the 'push' factors, land-man ratio (LMR) and proportion of marginal holdings (MHD) were significant. However the relationship with the proportion of agricultural labour force (ALF) was significant but inverse. The proportion of rural population educated above the middle level (EDM), for which we have data only for 1981, did not show any relationship to the share of non-agricultural employment.

However by 1991 the situation changed substantially. Rural non-agricultural employment appeared to be related significantly to urbanisation (external to the rural sector), land-man ratio and proportion of marginal holdings, both reflecting a 'push' out of agriculture. The proportion of bank deposits was not related.

Broadly, then, while in 1981 both demand and distress induced factors played important roles in determining rural non-agricultural employment, by 1991, besides urbanisation, the negative factors appeared to be more dominant. Nor, it may be recollected, was the increase in male non-agricultural employment in 1991 significant.

Summing up from the above it appears that the economy did receive a boost with growth in demand since the 1970s; however, it was unable to take advantage of the impetus for growth on a sustained basis. The continuing growth in the tertiary sector, then, in particular trade and commerce, does reflect its role as a 'residual' sector, absorbing labour in the

absence of an adequate growth in non-agricultural employment opportunities. Hence the emerging employment structure with a top heavy tertiary sector is weak.

Notes

[This paper is based on a project funded by the Indo Dutch Programme on Alternatives in Development (IDPAD) in collaboration with the Indian Council of Social Science Research (ICSSR) and the Institute for Social Science Research in Developing Countries (IMWOO), The Hague. IDPAD however does not take responsibility for the facts stated and conclusions reached in this paper. I am grateful to A Jayakumar for his statistical assistance.]

1 The district of Idukki was formed on January 26, 1972 with three taluks from Kottayam, Devicolum, Peermade, Udumbanchola - and Todupuzha taluk from Ernakulam district. Wynad was formed on November 1, 1980 comprising North Wynad taluk of Cannanore and South Wynad taluk of Kozhikode districts. Pathanamthitta was formed on November 1, 1982, largely from Quilon district with some villages from taluks in Alleppey district. The 14th district of the state, Kasargod, came into being on May 24, 1984, formed out of the two northernmost taluks, Hosdurg and Kasargod, in Cannanore district (*Kerala State Gazetteer*, Vol I, 1986). We have included Kasargod with Cannanore in our analysis.

South Indian Studies

A multi-disciplinary journal
Editor : M.S.S. Pandian

Re-evaluating old themes and problematising received forms of knowledge is a refreshing aspect of recent social science enquiries. Areas and aspects of social life which have remained outside the domain of academic knowledge, are now being brought under investigation. While conventional terrains of research show signs of having been overworked, there are indications of new ones emerging, provoking fresh insights and keen debates. These enquiries and debates, dispersed across disciplines, is recasting our understanding of South Indian society in a new light.

South Indian Studies intends to consolidate the gains of such enquiries by offering a broad forum to present and discuss current research on South India. In addition to papers and reviews, the journal plans to carry resume of major debates taking place in South Indian languages.

The journal invites papers, research notes, review articles and reviews for publication. All papers will be refereed before being accepted for publication.

Economic Outlook for India, 1994-96

This note presents forecasts for the Indian economy based on a macro-economic model for India being constructed by the Institute of Economic Growth and Delhi School of Economics Research Team on Macro-modelling for India.

With the long-awaited signs of industrial revival, the year that is about to close has given rise to new expectations. If these prove to be right and the tempo of industrial growth is sustained, the economy would have entered a new phase of development. The persisting problems, at least for a while, would be continued price rise and adverse current account balance, for which erstwhile solutions are unlikely to be effective. While some problems may get partly resolved and partly reconciled to, the real problems affecting the mass of the people will accentuate at the macro-economic level.

I Overview

THE fiscal year which closes on March 31, 1995 has been full of precariously balanced hope and despair. While assessing odds in favour of the former, our last report (*The Economic Times*, September 26, 1994) clearly highlighted this see-saw phenomenon between the bright and the bleak. It may be recalled that the report concluded with the statement, "...if the economy fails to revive now, then hope has no meaning. But for now, we do hope." It is now a matter of satisfaction that the 'hope' has prevailed and our perceptions have in many ways proved right. Real GDP growth is poised to exceed 5 per cent, and in particular, the index of industrial production is likely to show an increase of over 8 per cent. Also, real investment is poised for a substantial recovery as a result of a major pick-up in its private component. Our guarded assessment that 1994-95 will prove to be a turning point for the economy seems to have been borne out during the second half of the year. The present tempo of real GDP growth is likely to be maintained over the next two years. Again, as we had forecast, the price trend continues to be a cause for worry as the rate of inflation is predicted to exceed 10 per cent this year and, most likely, during the next year also. There has been some deceleration in export growth compared to the last year's actual growth as well as compared to our September forecast. For 1994-95 exports in US dollar terms are forecast to rise by about 14 per cent. On the other hand, revival of industrial activity in its wake has also accelerated growth of imports from about 6 per cent to nearly 25 per cent. Consequently, the trade gap for the year (1994-95) will exceed \$ 3 billion. However, since the country's foreign currency assets stand now at a comfortably high level of about \$ 20 billion, the large current account deficit poses no immediate problem.

For the next couple of years, the current trends are likely to continue or possibly accelerate. Real GDP growth will again be around 5.5 per cent in 1995-96 and over 6 per cent in 1996-97. Inflation rate, which slowed down to 8.3 per cent in 1993-94, is up again in the current year. The year will close with an average inflation rate of about 10.5 per cent. In the next two years it will show a marginal reduction but for both the years remain close to 10 per cent. The growth rate in exports in dollar terms is expected to be about 12 per cent for both the years 1995-96 and 1996-97, a bit slower than in

the current year, 1994-95. This is in line with the anticipated slow-down in world trade in nominal terms in 1994-95 and 1995-96. Import growth in dollar terms will be over 20 per cent in 1995-96 and somewhat lower in 1996-97. Despite this, simple calculations show that the trade deficit will widen and be sizeable in the next two years. In the event, current account deficit will also be substantial and larger than that anticipated for 1994-95. The projected trends imply near doubling of trade and current account deficits in 1995-96 and even more in 1996-97. Thus, it appears that while real GDP growth will keep up or even accelerate, the annual rate of inflation, measured in terms of the average of the wholesale price index for 52 weeks, staying close to 10 per cent and widening trade and current account deficits will be cause for serious concern.

The logic and assumptions underlying this prognosis for 1994-95 and 1995-96 are presented below as we analyse in more detail output, prices and trade and balance of payments. In the discussion that follows, we highlight our prognosis for the two years, 1994-95 and 1995-96. We also briefly comment on the likely trends beyond this two-year span.

Our estimates for key macro-economic variables for 1993-94 and forecasts for 1994-95 and 1995-96 are based on ongoing work on a macro-econometric model for India. They are presented in the accompanying tables. To facilitate comparison, the tables also contain preliminary/quick/advance official estimates available for some indicators for 1993-94 and 1994-95. Growth rates in the tables refer to estimates based on our forecasts. Table 1 provides production, capital formation, money and prices while Table 2 presents trade and balance of payments.

II Output

Let us first consider agriculture and allied activities which, with its contribution of about 30 per cent to total GDP, has an overbearing impact on the level of economic activity in the entire economy on the supply side as well as on the demand side. The long run trends in the output in this sector are determined by capital formation, yield and acreage. Private capital formation in this sector and the allocation of acreage to food and non-food crops within the sector are guided by the relevant relative prices and yields. As far as public investment is concerned, we assume first that total public investment in nominal

terms will grow by 10 per cent and second that agriculture will receive about 8 per cent of this total. Given price trends, it is clear that in real terms public investment remains stagnant. In this context, it is worth noting that total real capital formation in agriculture witnessed near-stagnation consequent to a decline in public investment in the recent past. Public investment at constant prices, in fact, declined to below Rs 12 billion in 1991-92 from about Rs 16 billion per year during the years 1985-86 through 1987-88.

Monsoon continues to determine the extent of fluctuations around the trend in both yield and acreage. The last monsoon was better than normal in terms of not only the total precipitation but also in its distribution across time and space. This is expected to result in agricultural GDP growth rate of about 3.3 per cent in real terms. For the year 1995-96, we assume the weather conditions to be just normal. This will lead to real GDP growth in agriculture to be of the order of 1.3 per cent, a lower rate due to normal weather compared to better than normal in 1994-95. Agricultural growth in the near future will move closer to the trend rate of 2.5 per cent as witnessed during the past two decades if at least normal weather conditions prevail and investment picks up. Faster growth of private capital formation and therefore output cannot be ruled out as a result of the possible shift in intersectoral terms of trade in favour of agriculture.

As noted earlier performance of the manufacturing sector gives reason to believe that the economy has crossed the first segment of the J curve associated with macro-economic stabilisation and structural adjustment policies. In 1993-94, the index of manufacturing production grew only at 2.3 per cent. For this year (1994-95) the annual rate of growth is expected to exceed 8 per cent. This translates into a growth rate of 7.2 per cent for real value added in manufacturing as against just about 3 per cent during 1993-94.

An essential precondition to a steady and satisfactory performance of the manufacturing sector is reliable and strong support from the infrastructural sector (power, transport, construction and minerals). In 1993-94, output (GDP) growth in this sector was 4.1 per cent. In 1994-95 this is likely to be a bit higher at 4.7 per cent and appears to be heading for an accelerated growth. The rate is estimated to be 7.1 per cent in 1995-96 which is likely to be more or less sustained in 1996-97. This explains partly why manufacturing sector may grow faster at

around 8 per cent in 1995-96 and 1996-97.

It appears that real capital formation in manufacturing during the current as well as the next two years will have to come largely from the private sector. Real fixed investment of the public sector is likely to stay almost constant because a 10 per cent increase in public sector's outlay on capital formation in nominal terms is going to be neutralised by an equal rate of inflation. Accordingly, it is only in 1997-98 when there is an abatement in inflation that public sector's capital formation will begin to increase in real terms. This is more or less true for all sectors as the pattern of nominal public investment observed in recent years is assumed to prevail during the years to come. Infrastructure has the largest share in the public investment (about 53 per cent), followed by manufacturing (16 per cent), public administration and defence (13 per cent) and services (11 per cent).

Private sector's real fixed investment in the manufacturing sector will, on the average, continue to grow between 10 and 12 per cent. This corroborates the prospects of accelerated growth of output in this sector. That private real fixed capital formation in infrastructure is unlikely to grow more than 6 per cent may constrain faster industrial expansion. However, in making projections we have assumed better management and higher capacity utilisation in this sector so that output in this sector as well as in the manufacturing sector will accelerate despite slow growth of real capital formation.

Perhaps, not surprisingly, it is the services sector which seems to attract a large and fastest growing quantum of private investment. In fact, private capital formation in this sector will level with that in manufacturing in 1995-96 and outpace it in the subsequent years. Output in this sector too exhibits a similar trend. Real value added in services is estimated to have risen by 7 per cent in 1993-94. It is forecast to increase by 7.8 per cent in 1994-95 and by the same percentage in 1995-96. In the subsequent year (1996-97), growth rate would be possibly higher. In contrast, growth of real GDP in public administration and defence is estimated to have remained steady at around 4.5 per cent during 1993-94 to 1995-96 as well as in 1996-97.

All this added up, implies real total GDP growth rates of 5.7 per cent in 1994-95 and 1995-96 and 6.4 per cent in 1996-97. For 1993-94 the rate of GDP growth is estimated to have been 4.4 per cent.

Aggregate real investment (added up by industry of use) which declined in 1993-94 is poised to grow by 7 to 8 per cent per annum during 1994-95, 1995-96 and 1996-97. Real fixed investment which, according to our estimates rose by 4.2 per cent in 1993-94, is forecast to increase at a rate of about 6.5 per cent per annum during the years 1994-95 to 1996-97.

Before we conclude this section, it is necessary to note that growth rates projected by us differ from the provisional/quick/advance estimates of the Central Statistical Organisation though they move in the same

direction and are broadly in the same ball park for comparable years. Even small difference in the base year levels for 1993-94 may lead to the noticeable differences in rates.

III Price Trends

As noted in the introduction, inflation around 10 per cent is likely to persist for another year or even more. This is not at all surprising insofar as it is a common consequence of all structural adjustment programmes. In fact, it is gratifying that the rate of price rise has not been as large as in most other countries undertaking economic reforms. It may be noted here that China is currently experiencing inflation of an order exceeding 20 per cent. All the same, persistent double digit inflation is a matter of serious concern in India for three reasons. First, since India has, by and large, had no history of high and sustained inflation so far, an episode of about 10 per cent per annum increase in the general price level lasting five to six years like the present one, despite six favourable monsoons in a row, raises alarm. Under India's democratic set up this has serious implications at the political level with a feedback effect on the economy. Second, a persistent escalation in the cost of living, which is generally higher for the bottom rung of the society, on top of a severely skewed income distribution and large mass of absolute poverty, is indeed painful

It is here that China has an advantage in facing a high inflation rate as compared to India. Third, since workers in the organised sector are subject to wage indexation, even though partial and lagged, disparities between workers in the organised and those in the unorganised sectors tend to increase with a potential for social unrest. In other words, the burden of structural adjustment, which presently include inflation as a major item, is falling more on those who cannot and should not be made to bear it.

We feel, however, that the current rate of inflation is not at all unmanageable and that its adverse consequences can be considerably neutralised if the government has the will to do so. That there has been much talk of a safety net but little action is disappointing. With good crops, food stocks exceeding 70 million tonnes and very comfortable foreign exchange reserves, the government has the wherewithal for alleviating the distress of those who are severely affected by the policy programmes. Any further delay in undertaking determined action on this front can only lead to a situation in which the continuation of the new policies itself is jeopardised.

As noted in the introduction, the rate of inflation measured in terms of the wholesale price index, averaged over 52 weeks of the year, is likely to be 10.7 per cent in 1994-95. Next year (1995-96) it is forecast to come down slightly to 10 per cent and, in 1996-97 a further decline to less than 10 per cent appears to be plausible.

TABLE 1: PRODUCTION, CAPITAL FORMATION AND PRICES
(Financial Year: April 1-March 31)

Items	(Rs billion)

Contrary to the common perception among policy-makers and the public at large, money supply growth is only one of the factors, perhaps the most important one, that determines the rate of inflation. Price trends in the economy are governed by a variety of factors on the demand and supply sides. These include money supply expansion relative to real GDP growth, output trends in agriculture, industrial demand for raw materials, import costs and costs associated with inputs as well as final products whose prices are directly or indirectly administered. In agriculture these include procurement and issue prices for major items like rice, wheat and sugar and support prices for several agricultural commodities. Administered prices in the industrial sector, viz, energy, mineral related, include chiefly power, petroleum and coal. In the 1990s, agricultural procurement/support prices rose, on the average, by about 15 per cent while energy-mineral related prices increased by 12 per cent per annum. We assume for the forecast period a modest annual increase of 8 and 10 per cent for the two groups respectively. In 1994-95, the rate of increase in the wholesale price of agricultural products was significantly higher than that of manufactures. In 1995-96 the two are likely to be more or less equal at 10 per cent. But, in the subsequent year again, the escalation in the prices of agriculture-based products will outpace that of manufactures.

It may be noted that money stock (wider definition) rose by 18.2 per cent in 1993-94. In the first half of 1994-95, monetary expansion has been larger than anticipated. Several policy measures were initiated by the Reserve Bank of India (RBI) in October 1994 while unveiling the busy season credit policy to restrain monetary growth. Foreign exchange inflows on account of foreign institutional investors are expected to slow down due to the narrowing of interest rate differentials between domestic and developed countries. The authorities are following cautious policies with regard to raising of funds abroad by Indian companies both short- and long-term, and their deployment. It is also expected that RBI credit to the central government will not exceed Rs 60 billion by the end of the year 1994-95, as agreed upon between the RBI and government of India. On account of these factors, RBI expects that money growth will be about 16 per cent for the year as against the earlier assessment of 14 to 15 per cent. We expect that monetary expansion will range 16 to 17 per cent and slow down subsequently. Consequently, money supply is assumed to increase by 16.5 and 16 per cent in 1994-95 and 1995-96 respectively.

Unlike in the past, when inflation was largely due to supply shocks arising from poor harvests or world oil prices or due to abnormalities like wars, etc, the present episode of inflation is harder to grapple with. In the first instance, controlling money supply growth is no guarantee that the inflation rate will return to a low rate, say, 5 per cent. Second, even if that were the case, money supply itself is not easily controllable because

of the large share of foreign exchange assets in high powered money (or reserve money). Third, excessively tight fiscal-monetary policies could hurt both production and investment and thus be sub-optimal from the long-term view. Finally, under the new policy regime which prominently includes globalisation, the influence of world prices added on to the need for depreciation of the rupee is going to increase. It may, however, be noted that since the value of the rupee remained stable over two years, 1993-94 and 1994-95, and world inflation rate is at a low level, this factor has contributed very little to the inflation that India is now experiencing.

It is necessary now to pursue vigorously supply management policies to control the double digit inflationary situation as there are strong enabling factors, viz, large food stocks and foreign exchange reserves, to sustain such policies. Effective use of foodgrain stocks and, timely and adequate import of commodities critical to inflation control, particularly those which are important in the common man's consumer basket are needed. Such import policies, if used judiciously, have favourable supply and demand effects – increase in supply and reduction in money growth which is increasing fast due to large Reserve Bank acquisition of foreign exchange inflows.

While demand management policies through reduction in gross fiscal deficit-GDP ratio have had a favourable impact on prices in the crisis years of early 1990s these have also had some adverse effects on the level of economic activity. For, whatever success has been achieved is largely at the cost of public investment, particularly in infrastructure and agriculture, both of which are critical to growth. Current expenditures, all of which are not necessarily productive,

could not be controlled in an adequate measure. Given the political realities, it should not be surprising that reductions in the fiscal deficit-GDP ratio could not be sustained. The scope of efforts on this front is now further limited under the present circumstances. This is evident from the so-called populist policies of several political parties which benefited handsomely at the recently held state level elections and may win in the states which just went to or are going to the polls in the near future. This obviously casts its shadow on central government policies.

IV

Trade and Balance of Payments

The country's prospects and actual performance in the external sector is much more contingent upon a variety of exogenous factors which are difficult to predict. In particular, the tempo of worldwide economic activity, fluctuations and trends in world prices are not only of critical importance but also hard to foresee. Correspondingly, forecasting is subject to greater hazards. All the same, one may make as good a prognosis as one can with the available information and judgment.

Let us take up exports first. Here it is important to note that the recent recession in the industrialised world has been more prolonged with hesitant recovery than any in the recent times. While the US and some European economies have more or less been looking up for the past one year, several others are still struggling hard. In fact, it is worth noting that even Japan has been severely affected by the current recession. Former Soviet Union which provided a market for Indian exports still continues to be in turmoil.

Notes: (i) g : Growth rate in per cent.

(ii) Figures in parentheses under DGCI and S series are preliminary estimates; Source: Reserve Bank of India Bulletin, October 1994.

(iii) Figures in parentheses for 1993-94 under Balance of Payments are quick estimates; Source: Annual Report, 1993-94, Reserve Bank of India, August 1994.

(iv) The mark-up of BOP exports and imports over DGCI and S are assumed to be about the same order as in the source cited in (iii).

With this variation across countries, any guess is hazardous. All the same, we take a plunge and assume that in 1994 total world real GDP growth would recover to 2.1 per cent from the very low rate of less than 1 per cent in 1992. Further recovery is foreseen during the period 1995 to 1997 with growth rates expected to be 2.7 per cent in 1995 and 3.2 per cent in 1996 and 1997. We also assume that world prices would go up by about 2 to 3 per cent over the three years, 1995, 1996 and 1997. It is of interest to note in this context that world prices of SITC categories (0-1, 2-4, and 5-9 except fuels (SITC 3) registered declines but recovered in 1994. It should be underlined that due to prolonged recession, inflation has so far remained negligible in most industrialised economies. Even oil prices have shown no upward movement though there have been considerable short-term fluctuations.

On the domestic policy side we assume that export subsidies, wherever continuing, would stay at the 1994-95 rates. But we do at the same time assume greater private sector effort and investment in market research, quality improvement, etc., which will steadily improve export market penetration. This has been done by imposing from 1994-95 onwards a smooth upward trend in exports on top of what would have been the normal outcome. It was argued in our September forecast that in the years to follow the existing exchange rate of Rs 31.37 per US dollar will not be maintainable if export growth has to be sustained. This has been confirmed once again by our present analysis. We have, therefore, assumed that the exchange rate (rupees to dollar) would go up to Rs 33 in 1996 and Rs 34 in 1997. This does not appear to be far-fetched in view of the reports that the premium on short-range forward transactions is currently ranging 4-6 per cent. It may be noted in this context that RBI has recently banned roll over of forward contracts at historical rates. However, it appears that the exchange rate adjustment assumed by us may fall short of the required measure of devaluation to maintain export growth in dollar terms exceeding 15 per cent per annum. There are distinct signals of slow down of export growth from the high rate of 20 per cent registered in the year 1993-94 which witnessed a substantial depreciation of the currency.

Our forecast is that, in dollar terms, exports will increase by about 14 per cent in 1994-95, by 11.3 per cent in 1995-96 and at a higher rate, 13 per cent, in the two subsequent years. Export growth forecast for 1994-95, it must be noted, is on the lower side of trends in the first 10 months of 1994-95. Preliminary figures point to nearly 17 per cent increase. The projected rates imply exports in dollar terms to be of the order of 25.4, 28.3 and 31.9 billion in the years 1994-95, 1995-96 and 1996-97 respectively. Exports were \$ 22.3 billion in 1993-94. These estimates correspond to trade figures of the Directorate General of Commercial Intelligence and Statistics (DGCI&S) which differ from the balance of payments statistics (RBI).

Manufactures (SITC 5-9) has the bulk

share of over three-fourths in total exports, followed by agro-based exports (SITC 0-1), raw materials (SITC 2-4) and lastly POL products (SITC 3). The shares of the latter three groups in the total are of the order of 13, 4 and 2 per cent respectively. Exports of manufactures in dollar terms are expected to grow at a faster rate compared to the others. Manufactured exports are forecast to grow at over 15 per cent in 1994-95 followed by a slow down (12.6 per cent) in 1995-96 and a recovery (13-14 per cent) in the subsequent two years. The minuscule exports of crude remain stationary whereas exports of other SITC groups (0-1, 2-4) will on average grow at about 7 per cent. Revival of the Soviet and other former centrally planned economies could also add to India's export growth.

As mentioned earlier, growth of imports has been spectacular during the first 10 months of 1994-95, recording nearly 24 per cent increase. This is largely the result of industrial revival and partly due to reduction in import tariffs. We expect this trend to continue so that for the year as a whole, imports in dollar terms would be higher by about 24.3 per cent compared to the preceding year. With continued uptrend in industrial activity, private capital formation, and further reductions and rationalisation of tariff rates as anticipated, the forecast of the growth of imports during 1995-96 is a bit lower at about 22.3 per cent followed by a further slowing down in 1996-97. Since imports in dollar terms in 1993-94 were at 23.2 billion the projected rates imply value of imports to be 28.8, 35.3 and possibly about 41 billion dollars in 1994-95, 1995-96 and 1996-97 respectively.

In making the above forecasts, we assume that domestic output of crude oil will be of the order of 33 million tonnes in 1994-95 compared to less than 30 million tonnes in 1993-94. Domestic crude production is expected to increase, on the average, by 10 per cent yearly during 1995-96 and 1996-97. With this, perhaps an optimistic assumption, the import bill on account of POL and related products, which constitute nearly 30 per cent of total imports, will increase by 15 and 18 per cent (in dollars) in 1995-96 and 1996-97. Thereafter, it is expected to slow down. Imports of manufactures including capital goods (SITC 5-9) share nearly two-thirds of the total imports bill and are slated to grow at a high rate. The growth rate in 1994-95 is expected to be as high as 28 per cent compared to about 8 per cent in 1993-94. However, in 1995-96 it would decelerate to 24 per cent and the trend is anticipated to continue in the next year (1996-97). Imports of SITC 0-1 category, which includes food and beverages and SITC 2-4, which comprise of raw materials and vegetable oils among others, share about 3 and 7 per cent of total imports respectively and are expected to maintain their shares implying their growth more or less at the same rates as that of total imports.

If the foregoing assumptions and the implied forecasts are valid, the trade gap for 1994-95 will turn out to be about \$ 3.4

billion. For 1995-96, the gap will widen to about \$ 7 billion and for the next year it may be even larger. However, the trade deficit will be wider on balance of payments basis as we allow for 2 and 2.5 per cent mark-up on DGCI&S values of exports and imports respectively. These mark-up rates are in line with the preliminary balance of payment estimates of the Reserve Bank of India (RBI) for 1992-93 and 1993-94.

The current account deficit, given the trade deficit, depends on net invisibles. RBI in its preliminary estimates of balance of payments for 1993-94 placed net invisibles at nearly \$ 1 billion. It is assumed that they will remain at about the same level in 1994-95 and then increase to \$ 2.4 billion in 1995-96. For 1996-97, they could be larger. Consequently the current account deficit is placed at \$ 2.9 billion in 1994-95 and at \$ 5.2 billion in 1995-96. As the trade deficit is expected to be much higher in 1996-97, the current account deficit would be larger than in 1995-96.

The ratio of trade deficit to GDP at market prices on the above reckoning will increase from less than half a per cent in 1993-94 to 1.3 and 2.3 per cent in 1994-95 and 1995-96 respectively while the current deficit will rise from a very low rate of one-tenth of 1 per cent in 1993-94 to nearly 1 per cent in 1994-95 and to 1.5 per cent in 1995-96. It is expected to be near 2 per cent by 1996-97.

V

Summing Up

With the long awaited signs of industrial revival the year that is about to close has given rise to new expectations. If these prove to be right and the tempo of industrial growth is sustained, the economy would have entered a new phase of development. This inevitably brings with it new problems and new challenges for all important economic agents, but in particular for the policy-makers. They would have to deal with more complex phenomena over most of which they would not have direct control as they have had in the past, at least apparently. New trade-offs would have emerged in different spheres of the macro-economy. Movement from a low level macro-economic equilibrium to one at a higher level is bound to cause problems. The persisting problems, at least for a while, would be continued price rise and adverse current account balance. Erstwhile solutions are unlikely to be effective under the new scenario. While some problems may get partly resolved and partly reconciled to, the real problems affecting the mass of the people will accentuate at the macro-economic level. Unless these are attended to properly and in time, gains at the macro-level may not be sustainable. This is because the country has inherited a large measure of absolute deprivation and inequity which act as a deadweight for the economy.

[Note prepared by Institute of Economic Growth (IEG) and Delhi School of Economics (DSE) Research Team on Macro-modelling of the Indian Economy for Spring Meeting of Project LINK UN, New York, March 15-18, 1995.]

Medical Community's Civil War

Plague in Retrospect

Taruni Madan

MOHAN RAO (*EPW*, October 15, 1994) examined the latest outbreak of plague in India from an economic and historical perspective. We can look at it from another angle. The epidemic provoked a virtual civil war among India's medical community, which assumed furious dimensions a couple of days after September 23, the day news papers carried terrifying headlines of pneumonic plague having struck Surat. Rumblings had, however, been heard earlier, in the beginning of September when the Haffkine Institute, Bombay questioned the technical acumen of the central government's, National Institute of Communicable Disease, in diagnosing bubonic plague in Beed district of Maharashtra. Haffkine did not sustain its campaign presumably for want of sufficient moral strength. Even Sharad Pawar, apprehensive that the diagnosis of a known or an unknown disease as plague might send foreign investors scampering back home or even ruin the existing economic structure of the state, could not carry conviction with the centre, which, in retrospect, it appears was hell bent on declaring the epidemic as plague. In the end the Maharashtra government had to order their health services all over the state to look for all suspicious characters, simulating any of the plague symptoms door to door, and offer them antibiotics or even hospitalisation, if they chose. For the poor in Maharashtra, generally scorned and exploited by the medical profession, it meant an unsolicited medical check-up.

Autonomous institutions, like the Indian Council of Medical Research and All India Institute of Medical Sciences proved more intractable perhaps because of their prestige, and the clout they enjoy with the powers that be. An ex-director of an ICMR called the Surat disease viral pneumonia. The AIIMS did not offer diagnostic wisdom, but took upon itself the role of propaganda warfare. Its missiles were calculated to cause demoralisation and disaffection in the enemy camp. In a unique two-in-one interview carried by *The Times of India* on September 28, the AIIMS microbiologist was pitted against the NICD director. The AIIMS questioned the laboratory procedures followed by the NICD, hinted at the latter's ignorance of latest procedures, and of course on its obsession with tetracycline. NICD's

half-hearted arguments revolved round expediency, amply justified, so their expert said, by an epidemic of such a serious nature. The deadliest missiles however emanated from the private sector, first from four Surat doctors, who produced radiological, epidemiological and clinical evidence that it was a melioidosis and not plague; and later from an itinerant epidemiologist based in Chandigarh who called it dengue or malaria. The missiles fired by the private sector had a devastating effect on the enemy, since they were aimed at the weakest chinks in its defences, i.e. absence of any data, even such elementary data, as the clinical course of the disease and the age groups affected. Doordarshan, inadvertently helped the rebel forces, in one of its question-answer sessions, where two aggressive women made the NICD expert look like a toddler in need of elementary medical education. A conviction now gained ground that what had been diagnosed as plague was not plague after all. At the Science Writers Conference, on September 30, a wail went up, from one amongst the audience, like a scream from a plague ward that NICD had perpetrated the greatest fraud in medical history.

Behind all behavioural manifestations, individual or collective lurk economic motives; a dictum accepted not only by the discredited marxists but by political thinkers of all hues. Highlighting a public health problem of potentially shattering physical and social consequences cannot fail to attract investments from responsible quarters in the government (or tackling it). Higher budgetary allocations mean more posts for expanding these institutions headed by satraps with little accountability. More money means more construction activity for spatial expansion of these empires. Higher budgetary allocations also mean more money for buying costly chemicals, reagents and equipment, which in turn mean more commissions. Indeed the satraps can demand heftier commissions in the present situation since they can tell the suppliers and agents that but for their ingenuity in inventing plague they would not have had this bonanza come their way. That is insofar as the legitimate budget, the parliament approved budget is concerned. Then there is the government-approved black money which comes in the form of financial assistance from inter-

national agencies and a myriad bilateral agencies. That too would be enhanced and would constitute a greater bonanza since such financial assistance can be gobbled up without the necessity of submitting an audited statement of accounts. No international agency can audit government accounts since that would amount to interference in our internal affairs. But considerations of sovereignty are kept in abeyance when prospects of foreign travel become visible on the horizon. A most vivid demonstration of our weakness in such matters was provided by two health ministry officials, a technocrat and a bureaucrat, who stepped out on plague-related foreign travel to go to Frankfurt, Copenhagen, London, Cairo, to finally land in Bahrain to explain to the WHO's eastern Mediterranean region the plague situation in India.

For once a scam had been generated in India, in which the politician, the businessman and the bureaucrat had no part to play. It was entirely the making of the technocracy, that too of a particular kind which enjoys the same order of respectability in the medical profession as the army officers deputed to work in the NCC enjoy in the army. Some businessmen were in fact ruined, and politicians, at least a few lost face. Take for example Delhi's Madan Lal Khurana, when he ordered the closure of schools goaded only by the simple desire of making a bit of political capital out of the available situation. He only managed to estrange Delhi's children and their angry parents. Children do not vote, but their parents do. Khurana must certainly have lost some votes, which means that he will have to do something dramatic in future. Plague did not spare even the WHO chief, Nakajima who risked his life to brave the plague winds of Surat to help a brother nation in peril. A man with an impeccable aristocratic bearing, and occupying the throne of UN's most effective and respected specialised agency, Nakajima's rather delicate sensibilities received a bit of a shaking up at his press conference on September 30, when a reporter put this bucolic question to him, "Did you come here all the way to give a clean chit to the NICD?"

The WHO thus found, itself caught in a tricky situation. More than their technical skill now their diplomatic skill was called into question. They however managed to manoeuvre themselves into safe position.

Plague is a disease of wild rodents, caused by a bacterium called *Yersinia pestis*, maintained among them by wingless insects called fleas which live in close association with them. A WHO team, in accordance with the promise made by their chief Hiroshi Nakajima, descended in the middle of

October and went to various places, and concluded their visit on October 25. At the end of the visit the New Delhi WHO office issued a press release which cannot fail to impress one as an diplomatic masterpiece. First, nowhere in the two-page document, is the name *Yersinia pestis* used. That satisfies the sceptics who from the very beginning were not sure about the real nature of the disease. Then the press release proceeds to fool the gullible by saying that the diagnosis of the disease in Surat "is compatible with pneumonic plague". The real masterstroke is struck when it says "...The outbreak occurred in the midst of outbreaks of several other diseases, like malaria, dengue, enteric fever, etc". That satisfies all the combatants in the civil war irrespective of caste, creed or sex or institutional affiliations, those who called it melioidosis or those who called it dengue or malaria or even those who were for viral pneumonia. The press release conjures up mouth-watering prospects of foreign travel, when it hints at "strengthening of epidemiological capacities".

The United Nations' most prestigious specialised agency cannot avoid embarrassment when trying to defend the indefensible. While it categorically says that there was no evidence of plague transmission in Bombay, Calcutta, Madras and Delhi, it has no explanation for 69 persons found serologically positive in Delhi. Of course the WHO cannot use such language as saying the NICD's laboratory personnel had committed some pardonable blunder in conducting their tests. Hence the emphasis in the press release about need for isolating the plague bacillus, unmistakably characterised as such.

To be fair, it must be said but for prompt issuance of the international travel guidelines by the WHO, there is no knowing how terrible the damage to India's foreign trade would have been. In 1983, an outbreak of a disease which to all appearances was pneumonic plague occurred in a remote area of Himachal Pradesh. Twenty-two persons contracted the disease, and 17 succumbed to it. The outbreak occurred in a perfect setting of contact with a wild plague focus; the symptomatology and the epidemiology were unmistakable. Shimla Medical College even isolated *Yersinia pestis*. In keeping with its past practices a team was sent by the union health ministry to snatch away credit for this investigation from the local authorities. Indira Gandhi, who was the prime minister of India at that time somehow got wind of the goings-on. After making her own assessment, she let slip a message to the concerned people that the results of the investigations in Himachal Pradesh should be published only after obtaining clearance from her office. Those familiar with her style

of functioning could see that concealed in this harmlessly worded message were threats of dire consequences. As could be expected, from a team operating in a remote inhospitable area, no incriminating evidence of the involvement of rodents or their flea parasites could be found. As a result no one talked of plague. The local WHO office was not even informed let alone asking their chief to come down on a rescue mission.

Someone ruminating on the present course of events remarked that Indira Gandhi did a tremendous service to Himachal Pradesh's economy, although in a negative sort of way by not letting half-baked scientists diagnose the state's ailments. Now, however, times have changed. With times the standards of behaviour. One may say even the concept of scientific method has undergone a change.

SAMEEKSHA TRUST BOOKS

Selections of Articles from *Economic and Political Weekly*

General Editor: Ashok Mitra

Industrial Growth and Stagnation

Edited by

Deepak Nayyar

A selection of essays presenting the main strands in the debate on industrialisation in India. The contributors analyse the factors underlying the deceleration in industrial growth from the mid-1960s to the mid-1970s and discuss the conditions and policies for a return to the path of sustained growth. Alternative hypotheses about the macroeconomic determinants of and constraints on industrial growth in India are examined, focusing on the performance of the agricultural sector, intersectoral terms of trade between agriculture and industry, disproportionalities within and between sectors, the level of investment in the economy, the nexus between public and private investment and the relative significance of supply and demand constraints.

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

SAGE PUBLICATIONS

THE INDIAN ECONOMY, 1947-92

Volume I: Agriculture

V M DANDEKAR

In this volume, the first in a three-volume study of the Indian economy, eminent economist V M Dandekar has put together his writings on Indian agriculture. The author addresses several issues including the disproportionately large burden of population that agriculture has to bear; the over-centralized nature of agricultural administration, research and education and the effect of the acute food shortages of the war and post-war years on food administration.

The Indian Economy, Volume I
1994 ■ 408 pages ■ Rs 350 (cloth) ■ Rs 175 (paper)

CONTESTED DOMAINS

The State, Peasants and Forests in Contemporary India
AKHILESHWAR PATHAK,

Contested Domains offers a comprehensive survey of the subject, and its author displays an impressive grasp of the literature concerning it. But it is the deep concern which he shows for the forest dwellers and their relationship with both the forests, and the Forest Department which really gives the book its appeal.

The Book Review

1994 ■ 176 pages ■ Rs 110 (cloth)

INDIA'S EUCALYPTUS CRAZE

The God That Failed

N C SAXENA

An excellent study. A series of valuable insights, based on careful statistical treatment. Saxena does not merely provide a series of well substantiated insights based on his own researches, he also situates his conclusions in the context of tree production in the Indian countryside.

The Book Review

1994 ■ 268 pages ■ Rs 275 (cloth)

MANAGING IRRIGATION TOGETHER

Practice and Policy in India

CLARENCE MALONEY and K V RAJU

The authors take a comprehensive view of such participation, covering both farmer organisation and farmers initiative for irrigation assessment, planning and management. Also, their treatment of the subject matter is quite comprehensive and the writing is extremely lucid. In all, the book has fifteen chapters, with the first and the last ones constituting the core of the book.

The Book Review

1994 ■ 340 pages ■ Rs 325 (cloth)

USER-FRIENDLY IRRIGATION DESIGNS

NIRMAL SENGUPTA

A serious and convincing effort to put the neglected user-friendly traditional irrigation systems in perspective. This book will interest as well as influence the thinking of modern engineers, workers engaged in reviving traditional systems, and social scientists.

Social Action

Any serious researcher on Indian irrigation systems would necessarily have to add this book to his reading list.

Down to Earth

1993 ■ 147 pages ■ Rs 185 (cloth)

MANAGING IRRIGATION

Analyzing and Improving the Performance of Bureaucracies

NORMAN UPHOFF with PRITI RAMAMURTHY

and ROY STEINER

The authors have done a singular service to those dealing with irrigation, both administrators and researchers, by comprehensively dealing with a very important subject hitherto untouched and neglected.

Economic and Political Weekly

1991 ■ 263 pages ■ Rs 250 (cloth)

DAIRY AID AND DEVELOPMENT

India's Operation Flood

MARTIN DOORNBOS, FRANK van DORSTEN,

MANOSHI MITRA and PIET TERHAL

In addition to providing a comprehensive review of the historical evolution of dairying and dairy policy in India, the book focuses attention on three major issues: the dependency syndrome, the replicability issue, and the equity impact of Operation Flood.

Here's one investment plan that takes care of four others!

*Tax Exemption. • Annual Dividend and Maturity bonus.
• Life Insurance Cover. • Free Accident Insurance.*

ULIP (Unit Linked Insurance Plan) from UTI is a single-window investment plan catering to more than one financial priority. Consider the benefits offered:

Tax Exemption: When you invest in ULIP your investments qualify for tax exemption under section 88 of the Income Tax Act. Moreover, investment made in the name of spouse and children is also eligible for tax exemption now.

Annual Dividend and Maturity Bonus: The annual dividend is reinvested in the plan. There is also a maturity bonus of 5% on the 10 year plan and 7.5% on the 15 year plan respectively. The annual

dividend for 1993-94 was 16.5%.

Life Insurance Cover: An insurance cover equal to your target amount without a medical examination. This cover is effective 6 months after you invest in ULIP.

Free Accident Insurance: An additional Rs. 30,000 accident cover, irrespective of your target amount.

Target Amount And Plan Period: You can choose either the 10 year or 15 year plan and aim for a target amount between Rs. 6,000 and Rs. 60,000.

For further details, please contact your nearest UTI branch, Chief Representative or agent.

UNIT TRUST OF INDIA

For your better tomorrow

All investments in mutual funds and securities are subject to market risks and the NAV of schemes may go up or down depending upon the factors and forces affecting securities market. Past performance is not necessarily indicative of the future results. Unit Linked Insurance Plan is only the name of the scheme and does not in any manner indicate either the quality of the scheme, its future prospect or returns. There is no guarantee that the Fund's objective will be achieved. Please read the offer document before investing.
